

TERM 2 METALS & NON METALS

WEEK 4-6

METALS & NON-METALS

- How can we tell if something is made of a metal or non-metal?
- How do we decide what material to use when we want to make or build something?

METALS & NON-METALS

PROPERTIES OF METALS

- Shiny
 - Hard and they feel heavy
 - Dense
 - Conduct heat and electricity well
 - Malleable
 - Ductile
- 

CONT.

- Does not melt or change heat in high temperatures
 - Mined from Earth
 - Cold to touch
 - Can rust and/or become dull
- 

PROPERTIES OF NON-METALS

- Dull
 - Brittle
 - Conduct heat well (insulators)
 - Soft and flexible
 - Hard and brittle
 - Do not rust
 - Neither cold nor hot
- 

EXAMPLES OF NON -METALS

- Rubber
 - Glass
 - Wood
 - Plastics
 - Ceramics
- 

ACTIVITY

1 Tick the box to show if the property described applies to metals and/or non-metals.

	Metal	Non-metal
a Most are good conductors of electricity.	☐	☐
b Most are flexible solids.	☐	☐
c Most are shiny when polished.	☐	☐
d Tend to be brittle solids that break rather than bend.	☐	☐
e Mostly poor conductors of heat.	☐	☐
f All but one are solids at room temperature.	☐	☐
g Some are gases.	☐	☐

2 Complete the word that describes the property of the material being used, and which is important for the use shown.

Aluminium is used for cooking pots as it is a good:

c_____ of _____

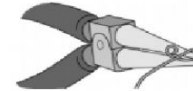

Iron is used for bridges as it is:

s_____

Silver is used for mirrors as it is:

s_____

Silver is bent to make jewellery as it is:

f_____

• IN SUMMARY

Metals and Non-Metals

Metals

Properties of Metals

- shiny
- dense
- malleable
- ductile
- conductor
- high melting point

Non-Metals

Properties of Non-Metals

- dull
- not dense
- brittle
- insulator

Grouped Into

Polymers	Glass	Ceramics
Plastic	Wood	Porcelain
Rubber	Clay	Fabric

METALS & CORROSION

- Metal objects are shiny when new
 - Overtime the shine disappears
 - Rust has a reddishbrown colour and rough in texture
 - Rust forms when iron corrodes
 - Rust is a type of corrosion
 - Other types of corrosion are; tarnish, patina,aluminium oxide
-
