

BEAUTY AND NAIL TECHNOLOGY

YEAR 4 – WORKBOOK

NAME:.....

APPLYING SAFETY AND HOUSEKEEPING

IMPORTANT THINGS TO KNOW:

The hair and beauty salon is a potentially dangerous place because of the tools and equipment we use. Everyone working in the salon needs to be aware of the possible safety risks and how to maintain the safety for themselves and clients.

Your behaviour should not create a safety risk – if you see something is potentially dangerous you should put it right.

Off course accidents do happen and we must know what to do. If need be we must carry out first aid. What do we mean by first aid ?

→ first aid means to help someone immediately after they have had an accident.

HAZARDS

Your physical well being is essential – not only for yourself but to others in the salon to.

It is EVERYONES responsibility to maintain a safe work environment

If you come across a potential hazard you must take action and report to your supervisor.

In a salon there are many things that can cause an accident, injuries or illness. You must be able to recognise them. What kind of things are found in a beauty salon which may cause an accident if not used properly? Name 5 things

→ examples are scissors, chemicals, hot wax, colour dyes for the eyelashes, electrical equipment like steamers, cuticle pushers, tweezers etc.

If they are used properly they are not **HAZORDOUS!**

WHAT IS A HAZARD ?

A HAZARD is something that has the potential to cause harm and you must REPORT it to the manager... E.G. a pair of scissors has been left on the edge of the work surface.

A hazard would be the scissors left on the edge, and the RISK is the chance that the scissors would fall and cut their legs

TYPES OF HAZARDS:

HAZARDS in a salon can be physical, chemical, or biological

PHYSICAL HAZARDS

What do you think is a physical hazard? Can you give an example?

→ physical hazards are physical objects that you can touch being in a place where it is not supposed to be. E.G. the shampoo boxes in front of the fire exit door, it must be a clear path free from obstruction

Different forms of PHYSICAL HAZARDS

Hazard	Potential harm	Preventative action
Spilt liquids on the floor – shampoo, coffee, water	People can slip on them and fall	Clean up spillages immediately they happen
Faulty electrical equipment	Can cause an electric shock or even a fire	Make sure the plugs are put on properly; never overload a socket with too many plugs; make sure plugs, sockets and cables are not cracked or worn.

Trailing cables of electrical equipment	Can cause someone to trip and fall or the hot tool can fall on them and burn them	make sure electrical equipment is unplugged when not in use and cables are safely stowed away. Be careful with hot tools so they do not touch your client's face or fall from the work surface on to them.
Electrical equipment	Heat	A hot tool can fall on someone and burn them
Waste bins	People can trip over them	Keep them near to you if you need them or safely put away
Smoking	Can cause fire if smokers are careless	Make sure people use ashtrays properly or better still, have a no smoking policy in the salon
Boxes of products and other stock	Can block fire exits or cause people to fall if not stored in the correct place	Ensure deliveries are taken to the storeroom as soon as they arrive and never leave them in the salon. Beware of lifting heavy boxes correctly.
Scissors and other sharp tools	Can cut people	Hold scissors correctly when carrying them (with your whole hand wrapped around the blades) and don't leave them on the edge of work surfaces.
Hot water or hot steam	Can cause burns and scalds to staff and clients	Ensure you regulate the taps properly and do not put your hand into hot water unless you know it is ok.
Waste products	Can spread bacteria or harm people if not disposed of correctly	Sharp objects like razor blades should be put in the sharps box. All other waste goes into a lined waste bin which should be emptied every day.

ELECTRICAL EQUIPMENT

Here are some guidelines for avoiding the risk of injury from electrical equipment:

- ♥ All electrical equipment must be properly fused and 'earthed' in accordance with the manufacturer's instructions.
- ♥ All frequently used electrical equipment e.g. facial steamers needs to be inspected and tested every six months by an electrician
- ♥ Make sure no wires are laying across the floor, they must be plugged in where they are being used.
- ♥ Plug sockets must not be overloaded because this may cause overheating and subsequent fires
- ♥ So not allow the clients to touch any electrical equipment
- ♥ Make sure that all electrical appliances are unplugged or disconnected before leaving the workplace

- ♥ Ensure that plugs, sockets and cables are not cracked or broken, if they are do not use them.

Inflammable

Toxic

Infectious-Biohazard

Corrosive

Hazard signs

CHEMICAL HAZARDS

Masego is going to help you understand how to handle one of the many potentially dangerous chemicals we use in the salon

Mamma Dintwe: Enters the back room where Masego is filling smaller bottles with hydrogen peroxide (bleach) from a large container. She is spilling the bleach and making a mess on her hands, the table, the floor and her clothes.

Mamma Dintwe: Masego! What are you doing?

Masego: The stylists and therapists asked me to quickly get them this stuff. I think they need it for doing eyelash tints and hair colours or something. I must do it fast because they are waiting with their clients.

Mamma Dintwe: But you are spilling this potentially hazardous chemical all over yourself and your clothes. Where are your protective overalls? You must go and wash that peroxide off your hands immediately and put on your overall. I will wipe up this mess.

Masego: Ee mma! But I've just arrived, and I didn't have time to put on my overall. I didn't know this stuff is dangerous!

Mamma Dintwe: It is bleach Masego, like Jik bleach but only much, much stronger – you must not get it on your hands or clothes, and you must always pour it carefully, so you do not spill. It will burn your skin and take the colour out of your clothes. The therapists have to be very careful when they use it so they do not burn the client or get it on their clothes. Especially when they are doing eyelash tints. They must never even prepare the chemicals near to the client. Can you imagine what it would feel like to get Jik in your eyes?

Masego: No – that would really hurt. I bet it could even make you go blind.

Mamma Dintwe: I also see that there is no label on those small bottles you are filling. It is very important that every chemical use in the salon is correctly labelled so that everyone knows what it is. Otherwise the wrong chemical could be used for a treatment and that could be very dangerous.

Masego: al've washed my hands mamma. Shall I put the tops on those bottles now to make sure no more bleach gets spilled?

Mamma Dintwe: Ee! that is important – you must never leave bottles of chemicals without their tops. And write a sticky label for each bottle. Here is booklet from the supplier which tells you exactly what this chemical is. Please read it carefully. There are many different types or strengths of hydrogen peroxide. The instructions from the manufacturer explain the safety precautions you must take with this product.

Masego: I will do it now mamma. I don't want to take any more risks with this stuff!

LESSON 2:

Date: _____

- ♥ There are five (5) main rules for working safely with chemicals which are explained in the scene between Mamma Dintwe and Masego. Write down these rules

1. _____

2. _____

3. _____

4. _____

5. _____

TYPES OF HAZARDS – TERMINOLOGY EXPLAINED

Flammable: Easily set on fire

Corrosive: Burns things away that it comes into contact with by a chemical action

Toxic: Acting as poison

Fumes: Gases given off by liquids

- May be visible or invisible
- May have a bad smell or no smell
- Can be highly flammable

♥ Draw a line with the correct word to the correct picture of hazard signs

CORROSIVE

TOXIC

BIOHAZARDOUS

FLAMMABLE

EXAMPLES OF CHEMICALS USED IN THE SALON

- ♥ HYDROGEN PEROXIDE → It is CORROSIVE and POISENOUS if it enters the Body
- ♥ EYELASH TINT → can be CORROSIVE if left on the skin to long
- ♥ NAIL POLISH → POISENOUS if swallowed or enters through the body e.g through the eyes
- ♥ NAILPOLISH REMOVER → Acetone is highly FLAMMABLE
- ♥ CLEANING MATERIALS → BLEACH and DISINFECTANTS → CORROSIVE if they get onto your skin

Clearly LABEL all bottles with their contents in and actual strength

Never PREPARE chemicals near to your client – it should always be done in the back room or a safe distance from your client – you could spill HAZARDOUS chemicals on your client

AEROSOLS must be stored in a cool place and thrown away when empty - just because its empty it does not mean its not DANGEROUS, they still FLAMMABLE

All STORAGE AREAS must be kept COOL as bacteria develops in warm conditions

COSMETIC PRODUCTS

Some clients are more sensitive than others, here are some guidelines to prevent problems:

DILUTION

Reducing the concentration of a chemical by adding water

- During each new treatment on a client, keep a watch out for sensitivity or allergies. Discontinue the treatment and apply first aid
- Keep detailed client records with dates on treatments, products and notes of any reactions
- Never use **SOLUTIONS** which are to strong. Always follow the recommended **DILUTIONS** for antiseptics
- Keep all products away from your and your clients eyes
- Eyelash tint should be used with extreme care – always follow instructions
- If a therapist shows sensitivity to the products, they must use **BARRIERS CREAMS**.

SOLUTION

Two or more substances mixed together (dissolving a solid in a liquid)

BARRIER CREAMS

Creams used to prevent chemicals coming into contact with the skin

LESSON 3

DATE: _____

1. Name three (3) different kinds of potential hazards in the salon.

- A. _____
- B. _____
- C. _____

2. What does corrosive mean?

3. Name three (3) things we need to remember when working with chemicals.

- A. _____
- B. _____
- C. _____

4. Why is electrical equipment potentially dangerous? Give three (3) causes of accidents involving electrical equipment.

- A. _____
- B. _____
- C. _____

5. What is the definition of fumes?

FIRST AID

Important information.

A business has the following responsibility in terms of first aid in the workplace.

- Provide first aid equipment and ensure that the workers and other persons has access to the equipment.
- That there are facilities for the administration of first aid
- Ensure that enough workers are trained to do first aid

First aid kits.

The first aid kits should provide basic equipment for treating of injuries such as:

- Cuts, scratches, punctures, grazes and splinters.
- Muscular sprains and strains.
- Minor burns.
- Bleeding wounds.
- Broken bones.
- Eye injuries.
- Electric shock

Each kit must be:

- Large enough to contain all the necessary items.
- Must be immediately identifiable with a white cross on a green background.

- Contain a list of the content to make sure that all used items are replaced.

Minimum content of a first kit.

First Aid kit

- Rubbing Alcohol
- Povidone Iodine
- Hydrogen Peroxide
- Cotton
- Cotton swab
- Band aid
- Gauze pads
- Gloves
- Bandage (triangular) Elastic
- Roller bandage
- Penlight
- Safety pins
- Forceps
- Scissors
- Tweezers
- Medical tape
- Splints
- Tongue depressor

EXPLANATION of first aid box contents:

- ♥ Sterile dressing – to place over wounds or burns, protecting them from further infections
- ♥ Gauze bandages – to hold dressings of injured limbs in place
- ♥ Crepe bandages – to give support to strains
- ♥ Triangular bandages – to immobilize the arm if broken or dislocated
- ♥ Adhesive plasters – to cover minor cuts to prevent infection
- ♥ Cotton wool – to help clean cuts and swabbing away blood to apply antiseptic
- ♥ Antiseptic liquid – to prevent cuts from becoming infected
- ♥ Tweezers – to remove splinters from the skin
- ♥ Scissors – to cut tape, bandages or clothes
- ♥ Safety pins – to hold bandages in place
- ♥ Eye pad – to reduce eye movement and protect from light if something enters the eye
- ♥ Disposable gloves – for blood spills

Other first aid equipment may be considered depending on the hazards found in the workplace. These equipment are:

- Automated external defibrillators
- Eye wash and shower equipment

First aid rooms.

Each workplace should have a first aid room equipped with all the equipment needed to treat injuries at the specific workplace.

The following items should be available in the first aid room:

- First aid kit.
- Hygienic hand cleaner and disposable paper towels.
- Bed with a waterproof surface or cover.
- Cupboard for storage.
- Containers for the disposal of waste, sharps.
- Blankets.
- Stretchers.

A first aid room should.

- Be located within easy access to water (hot and cold) and toilet facilities.
- Offer privacy.
- Be easily accessible to emergency services.
- Be well lit and ventilated.
- Be big enough for multiple treatment of people.
- Be clearly marked.

Record keeping.

Record must be kept of:

- Person treated.
- Reason for treatment.
- First aid done.
- Materials used.
- Date and time of the treatment.
- Name of the first aider.
- Were next of kin contacted.
- Where emergency services contacted.

HOW TO TAKE ACTION IN CASE OF MINOR INJURIES

Here are some very basic notes and illustrations on possible injuries you might come across in the salon and how you should deal with them.

	Chemical in the eye Rinse with luke warm water immediately	
scald an injury caused by moist heat such as from facial steamer or wax	Burn or scald Run the area in cold water or if it is a serious burn, cool the area with cold water and cover lightly with sterile gauze	
sterile cleaned of all bacteria and viruses	Electric shock Turn off the power source before attending to the casualty being electrocuted.	
gauze light cloth used to cover wounds	Cuts Clean the wound gently using a sterile gauze, apply pressure till the bleeding stops and use a sterile adhesive plaster to cover the wound	

Fainting

Lower the head of the client between the knees if they feel like fainting. If they have fainted, put them in a lying position raise the legs to increase the flow to the head.

Nose bleeding

Sit the casualty down with the head bent forward towards a sink or any container that can catch the blood. Loosen any clothing around the neck. Ask them to breathe air in through the mouth as they firmly pinch the soft part of the nose for a few minutes.

LESSON 4:

DATE: _____

1. Find the following words.

injuries bones burns forceps scissors gloves bandage gauge
cotton swab iodine tweezers tape splints plasters kit

t	a	p	e	a	p	a	P	r	l	a	k	b	a	n	d	a	g	e	q

2. Explain the following first aid box content.

♥ Crepe bandages _____

♥ Tweezers _____

♥ Sterile dressing _____

♥ Safety pins _____

♥ Antiseptic _____ liquid

♥ Scissors _____

3. What type of injuries should a first aid kit be able to treat?

4. Find pictures of items found in a first aid box.

EMERGENCY PLANS

Important information.

An emergency plan is a written set of instructions that outline what workers and others at the workplace should do in an emergency. An emergency plan must provide for the following.

- Alarms signalling an emergency.
- Evacuation procedure.
- Numbers for notifying emergency services like police, ambulance, fire department etc.
- Onsite medical treatment and assistance.
- Good and effective communication between the people at the workplace.
- Practising the procedures regularly.
- Training of people in the workplace.

What type of emergencies should be covered?

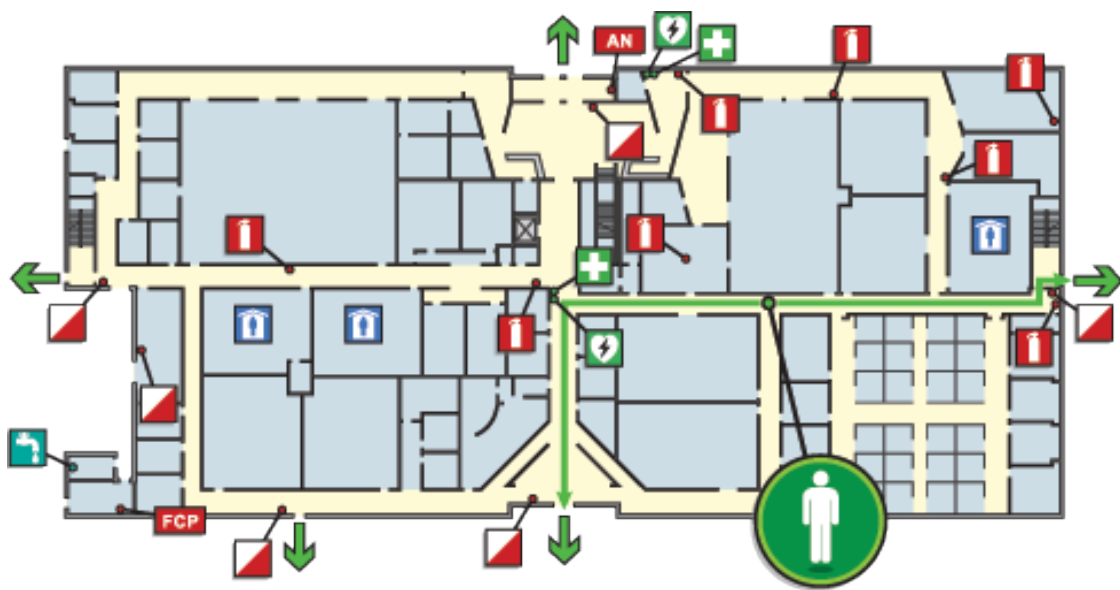

This will differ from workplace to workplace depending on the hazards found at the workplace. But the most common emergencies is:

- Fire.
- Medical.
- Protect action.
- Bomb treat.

What should the workers know about the emergency plan?

- Emergency contact details and where to find them for example fire brigade, poison information centre, police etc.
- Who is in charge of specific roles and responsibilities etc.? First aid, Fire marshal, evacuation leader.
- The different sirens, bells or mechanisms for alerting people.
- A map of the workplace illustrating the location of fire equipment, evacuation routes, first aid equipment, assembly points.

Example of an evacuation plan map.

LESSON 5:

DATE: _____.

1. Explain what an emergency plan is? (2)

2. What should an emergency plan must provide? (7)

3. What type of emergencies should be covered? (4)

4. What should the workers know about the emergency plan? (8)

/20

IMPLEMENT AND SUPPLY SANITATION TO WORK ENVIRONMENTS, EQUIPMENT AND TOOLS

SANITATION

Sanitation is the application of measures to promote public health and prevent the spread of infectious diseases.

The importance of sanitation cannot be overemphasized. Beauty services bring the Beauty Therapist in direct contact with the client's skin and nails. Understanding sanitary measures insures the protection of the client's health.

A client or Beauty therapist with an infectious disease could spread it to others. Hence, Beauty Therapists having colds, or any communicable disease must not be permitted to serve client's. Client's suffering from an infection disease must not be accommodated in a beauty salon. In this way, the best interests of other clients will be served.

Definitions Pertaining to Sanitation

1. **Sterilize** – to render sterile; to make free from all bacteria (harmful or beneficial) by the act of sterilizing.
2. **Sterile**- free from all germs.
3. **Antiseptic** – a chemical agent which may kill or retard the growth of bacteria.
4. **Disinfect** – to destroy bacteria on any object.
5. **Disinfectant** – a chemical agent having the power to destroy bacteria (germs or microbes).
6. **Bactericide** – a chemical agent has the power to destroy bacteria (germs or microbes).
7. **Germicide** – a chemical agent has the power to destroy bacteria (germs or microbes).
8. **Asepsis** – freedom from disease germs.
9. **Sepsis** – poisoning due to pathogenic bacteria.
10. **Fumigant** – vapor used to keep clean objects sanitary.
11. **Sanitize** – to render objects clean and sanitary.

LESSON 6:

DATE: _____

Match the column – match the sanitation term to the correct definition. Draw a line to the correct answer

1.	Disinfectant	1.	a) A chemical agent which may kill or retard the growth of bacteria.
2.	Fumigant	2.	b) free from all germs.
3.	Antiseptic	3.	c) A chemical agent having the power to destroy bacteria (germs or microbes)
4.	Sterile	4.	d) Disinfect – to destroy bacteria on any object.
5.	Sterilise	5.	e) Vapor used to keep clean objects sanitary.
6.	Disinfectant	6.	f) to render sterile; to make free from all bacteria (harmful or beneficial) by the act of sterilizing.

METHODS OF SANITATION PROCEDURES

SANITISING WITH DISINFECTANT

1. Wash implements thoroughly with soap and hot water.
2. Use plain water rinse to remove all traces of soap.
3. Immerse implements in a wet sanitizer (containing approved disinfectant) for that required time.
4. Remove implements from wet sanitizer, rinse in water and wipe dry with clean towel.
5. Store sanitized implements in individually wrapped cellophane envelopes or keep in cabinet sanitizer until ready to be used.

Sanitizing with Alcohol

To sanitize manicuring or other implements, immerse them in 70% alcohol for 20 minutes. Implements having a fine cutting edge are best sanitized by rubbing the surface with a cotton pad dampened with 70% alcohol. This application prevents the cutting edges from becoming dull. Electrodes may be safely sanitized by gently rubbing the exposed surface with a cotton pad dampened with 70% alcohol.

After sanitation, place implements into a dry sanitizer until ready for use.

SANITIZING FLOORS, SINKS AND TOILET BOWLS

The disinfection of floors sinks and toilet bowls in the beauty salon calls for the use of such commercial products as Lysol, CN, pine needle oil or similar disinfectants. Deodorants are also useful to offset offensive smells and for imparting a refreshing odor.

Whatever disinfectant is being used, make sure that it is properly diluted as suggested by the manufacturer.

Safety Precautions when sanitizing

The use of chemical agents for sanitation involves certain dangers, unless safety measures are taken to prevent mistakes and accidents. Follow these safety rules:

1. Purchase chemicals in small quantities and store them in a cool, dry place; otherwise they deteriorate due to contact with air, light and heat.
2. Weigh and measure chemicals carefully.
3. Keep all containers labeled, covered and under lock and key.
4. Do not smell chemicals or solutions, as some of them have pungent (strong) odors.
5. Avoid spilling when diluting chemicals.
6. Prevent burns by using forceps to insert or remove objects from the source of heat.
7. Keep a complete first aid kit on hand.

Sanitizing Rules

Chemical solutions in sanitizers should be changed when necessary.

Manicuring tools must be kept in a disinfectant solution (70% alcohol) during the process of giving a manicure.

All articles must be clean before being sanitized.

Facial bowls, manicure bowls and pedicure foot spas must be sanitized before and after each use.

All manicuring implements must be sanitized after each use on a client.

Sanitize electrical appliances (facial steamers, magnifying lamps) by rubbing the surface with a cotton pad dampened with 70% alcohol.

All cups, soaking bowls or similar objects must be sanitized before being used for other clients.

LESSON 7:

DATE _____

Sanitized	Chemical	Client	Disinfectant	Tools
-----------	----------	--------	--------------	-------

1. _____ solutions in sanitizers should be changed when necessary.
2. Manicuring _____ must be kept in a _____ solution (70% alcohol) during the process of giving a manicure.
3. All tools must be clean before being _____.
4. Facial bowls, manicure bowls and pedicure foot spas must be sanitized before and after each use.
5. All manicuring tools must be sanitized after each use on a _____.

/5

How should electrical appliances be sanitized?

STERILIZATION

Sterilization is the process of making an object germ-free by the destruction of all kinds of bacteria, whether beneficial or harmful.

Sterilization is of practical importance to the Beauty Therapist because it deals with methods used to prevent the growth of germs or destroy them entirely, particularly those which are responsible for infections and communicable diseases.

There are five well-known methods of sterilization and sanitation. These may be grouped under two main headings:

1. PHYSICAL AGENTS

a.) Moist heat

- Boiling water at 100 degrees Celsius for twenty minutes. (This method is no longer commonly used in beauty salons).

- Steaming – requires a steam pressure sterilizer. It is used in the medical field to kill bacteria and spores.

b.) **Dry heat** (baking) is used in hospitals to sterilize sheets, towels, gauze, cotton and similar materials.

c.) **Ultra-violet rays** in an electrical sanitizer are used in beauty salons to keep sanitized implements sanitary.

2. Chemical Agents:

a.) Antiseptics and disinfectants are presently used in beauty salons.

b.) Vapors (fumigants) in a cabinet sanitizer are used to keep sanitized implements sanitary in beauty salons.

Chemicals are the most effective sanitizing agents that may be used in beauty salons for destroying or checking bacteria. The chemical agents used for sanitizing purposes are antiseptics and disinfectants.

- An ANTISEPTIC is a substance which may kill, or retard the growth of bacteria without killing them. Antiseptics can as a rule be used with safety on the skin.

- A DISINFECTANT destroys bacteria and is used to sanitize implements.

Several chemicals can be classed as antiseptics or disinfectants: a strong solution may be used as a disinfectant and a weak solution as an antiseptic.

(Example: formalin, alcohol or "quats").

1. Tabulate the different methods of sterilization under the following headings.

Physical agents	Chemical agent
1.	1.
2.	2.

3.	3.
----	----

Requirements of a good disinfectant:

1. Convenient to prepare
2. Quick acting
3. Preferably odorless
4. Non-corrosive
5. Economical
6. Non-irritating to skin

A **WET SANITIZER** is acceptable large enough to hold a disinfectant solution in which the objects to be sanitized are completely immersed. A cover is provided to prevent contamination of the solution. **WET SANITIZERS** come in various sizes and shapes.

Before immersing objects in a **WET SANITIZER** containing a disinfectant solution, be sure to:

- Wash the implements thoroughly with hot water and soap.
- Rinse thoroughly

This procedure prevents contamination of the solution. Besides, soap and hot water remove most of the bacteria.

After the tools are removed from the disinfectant solution, they should be rinsed in clean water, wiped dry with a clean towel and stored.

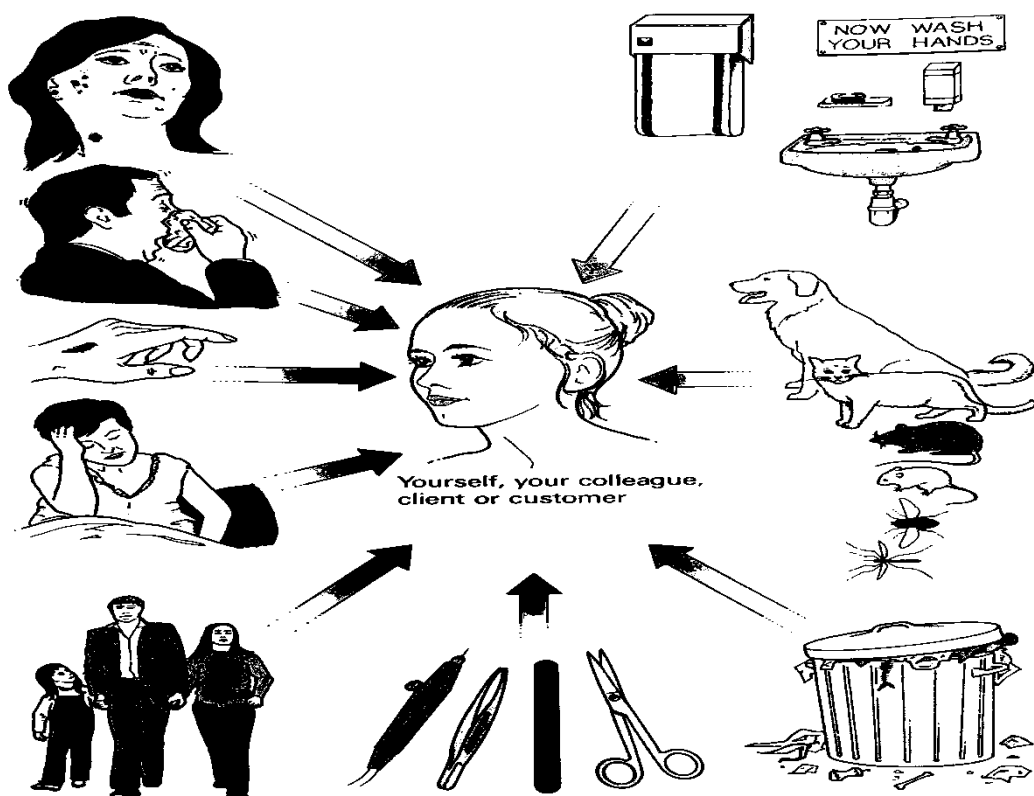

DRY OR CABINET SANITIZER is an airtight cabinet containing an active fumigant. The sanitized (tools) implements are kept clean by placing them in the cabinet until ready for use.

ULTRA-VIOLET RAY ELECTRICAL SANITIZER

Ultra-violet ray electrical sanitizers are effective for keeping implements clean until ready for use. Implements (tools) must be sanitized before they are placed in the ultra-violet sanitizer. Follow manufacturer's directions for proper use.

AREAS WHERE CONTAMINATION CAN BE ENCOUNTERED

1. Unclean hands
2. Contaminated tools
3. Sores and pus
4. Discharge from nose and mouth
5. Shared use of items such as towels and cups
6. Close contact with infected skin cells
7. Contaminated blood or tissue fluid

Lesson 8:

Date _____

1. Name the requirements needed for a good disinfectant.

a. _____

b. _____

c. _____

d. _____

e. _____

f. _____

2. Find pictures where contamination can be encountered.

TOOLS AND EQUIPMENT

TOOLS, EQUIPEMENT AND WORKING AREAS	
	
Cuticle nipper	Cuticle pusher
	
Nail brush	Foot spa
	
Manicure bowl	Soaking off bowl

	
Emery board	Nail cutter
	
Towels	Tip cutter
	
Steamer	Trolley
	
Block buffer	Dippen dish

Cuticle trimmer

Nail scissors

Plinth (massage bed)

Facial bowl

Mask mixing bowl

Chair

manicure work station

roller wax cartridge

Wax pot

Tweezers

Kidney bowl

Foot rasp

Foot file

EQUIPMENT AND TOOLS NEEDED

PRODUCTS FOR MANICURES

PRODUCTS	FUNCTION
Disinfectant	Destroys / kills bacteria
Antiseptic	Reduces bacteria, viruses and fungus on the skin
Styptic product	Stops bleeding when applied
Polish remover	Dissolves polish
Cotton balls / cotton swabs	Used to apply polish removers and remove lotions from the nail plate
Cuticle remover cream	Loosens dead skin
Soaking solution	Softens skin, loosen dirt, aids in pushing back cuticle
Cuticle cream / oil	Softens cuticle skin, moisturizes brittle nails
Hand lotion	Softens skin and aids when providing massage manipulations
Base coat	Evens out nail plate, holds nail colour to nail, prevents pigments from penetrating the nail plate
Liquid polish	Creates a coloured effect
Top coat / Sealer	Protects coloured polish from chipping, fading and peeling
Nail dryer	Aids in fast drying of polish
Nail conditioner	Applied to nails to avoid dryness

IMPLEMENTS

IMPLEMENTS	FUNCTION
Emery board	Shortens and shapes natural nails
Cuticle pusher	Pushes cuticles back
Orangewood stick	Loosens debris and is used to apply creams and clean under free edge
Cuticle nipper	Trims cuticles
Nail brush	Cleans nails and removes debris before polishing
Block buffer / 3 Way buffer	Smoothens surfaces of the nail
Cosmetic spatula	Removes cream from jars in an effort to meet infection control guidelines
Hand bowl	Allows comfortable soaking of the hands
Disposable towels	Dries hands and nails

EQUIPMENT

EQUIPMENT	FUNCTION
Nail service table	Provides a place for all tools to be laid out and is the proper height for comfort
Nail service stool	Allows easy access to the client, seat is adjustable
Client's chair	Provides back support and comfort to client during nail service
Wet disinfectant container	Holds disinfectant for disinfecting implements under infection control guidelines
Glass container	Holds cotton balls, cotton swabs and other accessories
Lamp	Lights the area for close detail work; generally uses a 40-watt bulb

LESSON 9:

DATE _____

1. Complete the following table by filing in, in Column A whether it's a product, implement or equipment and write in Column B each one's function.

	<u>Column A</u>	<u>Column B</u>
Emery board		
Lamp		
Hand lotion		
Base coat		
Cosmetic spatula		

2. Complete the missing words.

service; lighten; manicure; cosmetic; disinfectant
--

2.1 Clean nail table with

2.2 Always file the nails in a before they are soaked.

2.3 Manicure is the care of the hands and fingernails.

2.4 Clean, disinfect and place the correct nail implements on the nail table.

2.5 If your client is feeling heat or burning, the pressure and lower the speed of the buffing.

PRODUCTS FOR PEDICURES

PRODUCTS	FUNCTION
Antiseptic	Reduces bacteria, viruses and fungus on the skin
Polish remover	Dissolves polish
Cotton balls / cotton swabs	Used to apply polish removers and remove lotions from the nail plate
Cuticle remover cream	Loosens dead skin
Soaking solution	Cleans, softens skin and loosen dirt
Foot scrub	Removes dead skin cells
Massage lotion	Is used for relaxation through massage and moisturizes
Foot powder	Dries and deodorizes
Base coat	Evens out nail plate, holds nail colour to nail, prevents pigments from penetrating the nail plate
Liquid polish	Creates a coloured effect
Top coat / Sealer	Protects coloured polish from chipping, fading and peeling
Nail dryer	Aids in fast drying of polish

IMPLEMENTS

IMPLEMENTS	FUNCTION
Emery board	Shortens and shapes toenails
Nail clipper	Shorten toenails
Toe separators	Separate toes during polish technique
Foot file / Paddle	Softens and removes calluses
Cuticle pusher	Pushes cuticles back
Orangewood stick	Loosens debris and is used to apply creams and clean under free edge
Cuticle nipper	Trims cuticles
Foot brush	Cleans nails and removes debris
Cosmetic spatula	Removes cream from jars in an effort to meet infection control guidelines
Cosmetic spatula	Used to separate toes to examine feet for any abnormalities
Foot bath	Allows comfortable soaking of the feet

EQUIPMENT

EQUIPMENT	FUNCTION
Pedicure table	Provides a place for all equipment, products and implements to be laid out
Service stool	Allows easy access to the client, seat is adjustable
Client's chair	Provides back support and comfort to client during pedicure service

LESSON 10:

DATE _____

1. Complete the following table by filing in, in Column A whether it's a product, implement or equipment and write in Column B each one's function.

	<u>Column A</u>	<u>Column B</u>
1.1 Foot soak		
1.2 Foot file		
1.3 Toe separators		
1.4 Pedicure table		
1.5 Cosmetic spatula		

2. Name the five (5) steps of preparation for a pedicure.

1. _____
2. _____
3. _____
4. _____
5. _____

SANITATION – HAND HYGIENE

Introduction:

Workplace hygiene is essential for a safe environment. Infections can be easily passed from person to person via direct or indirect contact – this is known as cross-infection.

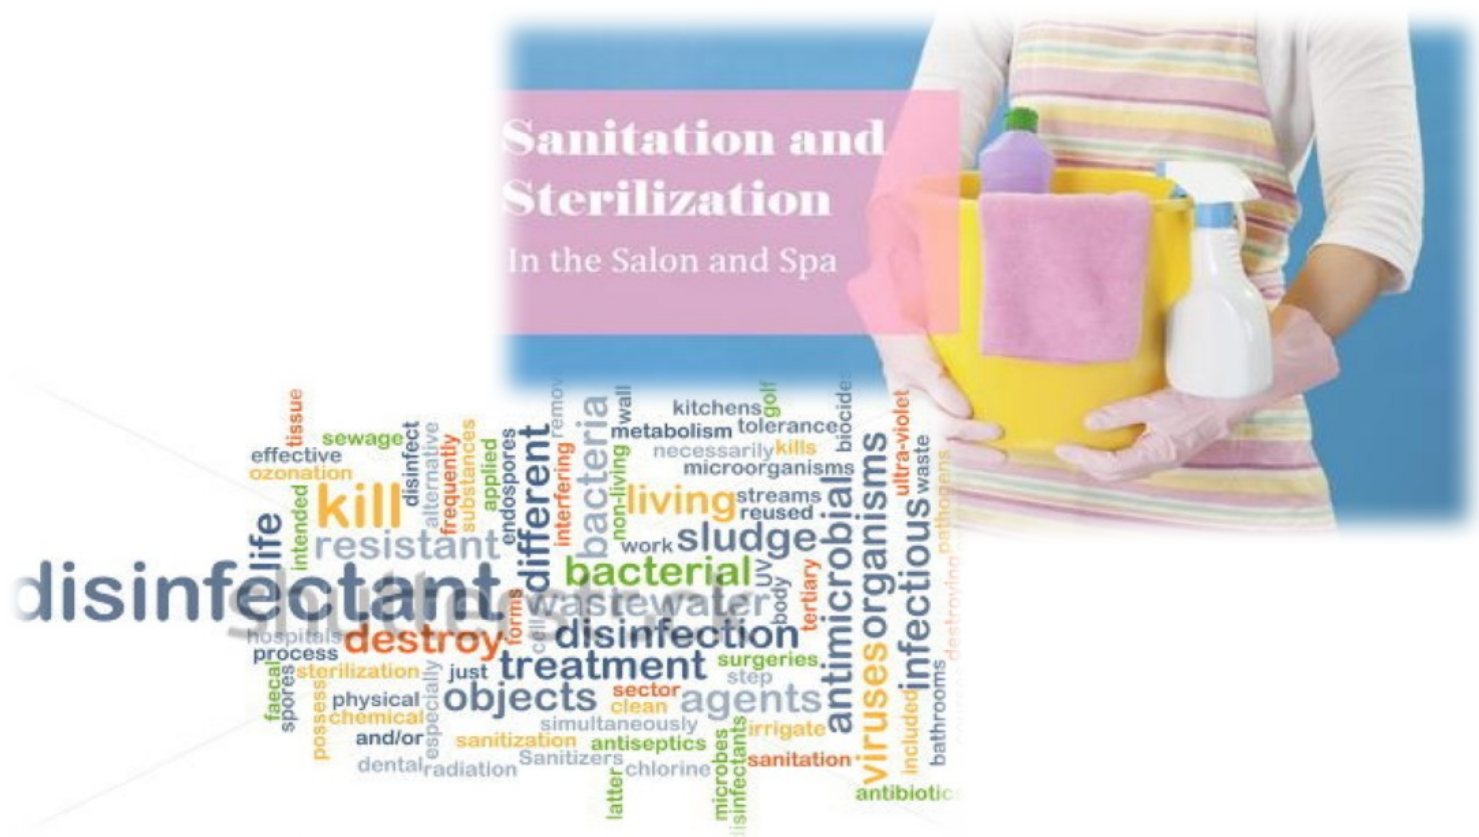

Direct contact occurs when an infection passes from one person to another through:

- Touching the skin
- Sneezing
- Coughing
- Breathing

Indirect contact occurs when infection passes from one person to another through an unclean object, for example a towel or dirty equipment and tools.

Preventing the spread of bacteria through:

1. SANITATION – Hand hygiene
2. DISINFECTION
3. STERILISATION – Wet and dry sterilisation

1. Sanitisation

Regular cleaning and washing using warm soapy water promotes health by removing dirt and reducing the growth of germs and bacteria. You can wash your hands with soap and water or use an alcohol-based hand sanitiser.

1.2 Hand hygiene should be performed:

- Before and after contact with each client;
- After eating or smoking;
- After going to the toilet;
- After blowing your nose, coughing or sneezing;
- After handling laundry;
- After contact with blood or other bodily substances; and
- After removing gloves.

How to wash your hands:

1. **Wet your hands with warm, running water and apply liquid soap or use a bar of soap.**
2. **Lather well.**
3. **Rub your hands vigorously together for 15-20 seconds.**
4. **Scrub all surfaces, including the backs of your hands and wrists between your fingers and under your fingernails.**
5. **Rinse well.**
6. **Dry your hands thoroughly with a disposable towel.**
7. **Use a paper towel to close the tap.**

Hand Wash

1.3 Hand hygiene using an alcohol-based hand rub

Alcohol-based hand rubs can be a fast and effective way to sanitise hands. They can reduce the number of germs on your hands. They do not remove dirt from your hands.

An alcohol-based hand rub should contain between 60% – 80% alcohol. An alcohol-based hand rub may be used for hand hygiene **when hands are not soiled**.

Apply alcohol hand rub using the following method:

- ✓ Apply the amount of hand rub recommended by the product manufacturer to the palms of hands;
- ✓ Rub hands together, making sure you cover in between fingers, around thumbs and finger tips;
- ✓ Rub until hands are dry.

BODY FLUID SPILL CLEAN-UP PROCEDURE

This procedure must be followed by all the therapists

DEFINITION: → body fluids are BLOOD, FECES, URINE, VOMIT AND SALIVA.

ROLES AND RESPONSIBILITIES:

♥ SUPERVISORS:

Ensuring that all therapists involved in a body spill clean-up are supplied with the appropriate protective equipment.

The protective equipment must be worn during clean-up, disinfection and disposal procedure

♥ STAFF:

Responsible for wearing the protective equipment and following procedures

PROCEDURES

LARGE SPILL OF BODILY FLUIDS such as a sewage leak

- rubber gloves;
- rubber boots and
- water proof coveralls must be worn to prevent splashing

SMALL SPILL OF BODILY FLUIDS such as a small pool of blood

- rubber gloves and
- rubber boots must be worn to prevent splashing of blood

DRIED BLOOD OR SMALL SPILL OF BODILY FLUIDS such as a nose bleed

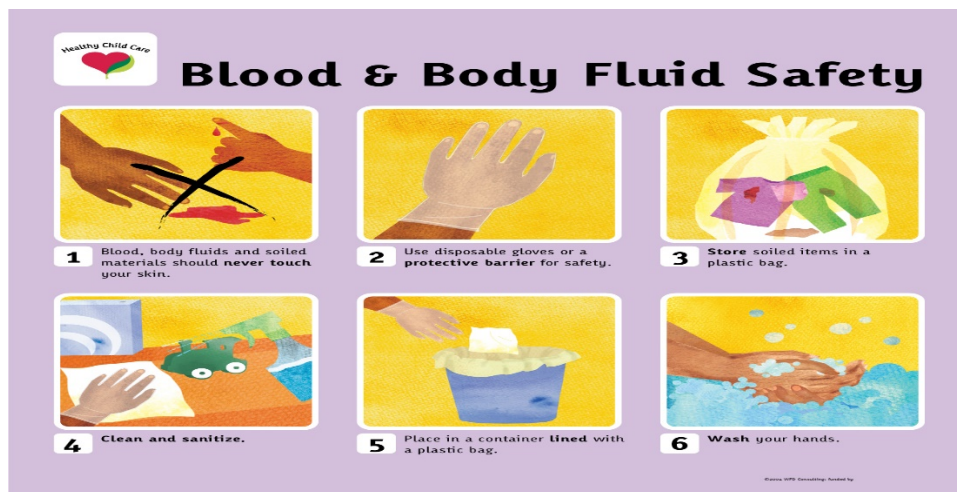

- just rubber gloves to be worn

CLEAN UP PROCEDURES:

Large or small spills

- Use PAPER TOWELS to soak up the spill
- pour DISINFECTANT directly onto the materials (paper towels)
- Pour 10% BLEACH SOLUTION onto the materials (paper towels) and leave for 10-30 minutes
- After the materials (paper towelling) are picked up and put in a trash bag, pour more DISINFECTION on the spill and wipe up with paper towelling

BASIC HYGIENE AND ACCIDENTAL EXPOSURE:

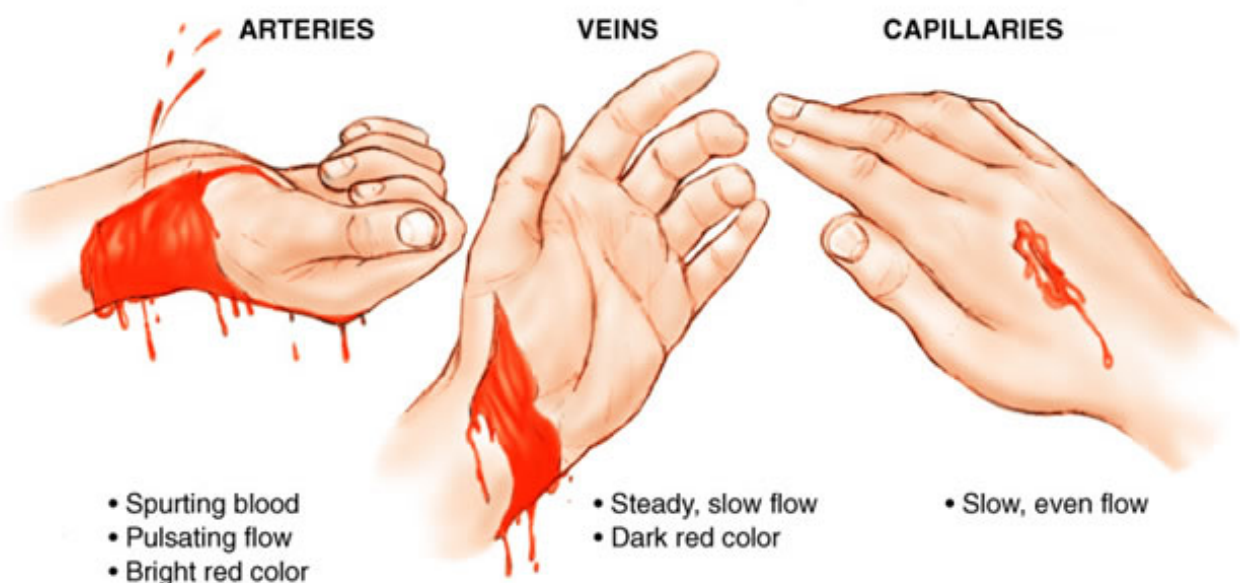

- ♥ Therapists must wash their hands with SOAP and RUNNING WARM WATER directly after removing their RUBBER GLOVES
 - ♥ DISINFECT all equipment that can be used again
 - ♥ By accident the skin comes into contact with body fluids – wash the area with ENOUGH SOAP and WATER
 - ♥ If the eyes or mouth come into contact with body fluids – wash with WATER
- Report all accidental exposures to body fluids to the supervisor

BLEEDING

Important information.

Generally, bleeding is of a minor nature and includes small cuts, grazes, etc. However bleeding may be severe and life threatening if a large vein or artery has been injured. It is important to know how to help a person that is bleeding and how to stop the bleeding or prevent the person from bleeding out.

How do we help a person that is bleeding?

Step 1. Avoid any direct contact with the patient's blood or other body fluids.

- Use disposable gloves if possible.
- If gloves are not available, place your hands inside a plastic bag.
- If there has been any contact with blood or any other body fluids, wash your hands or any blood splashes on the skin thoroughly with soap and water as soon as possible.

Step 2. Apply direct pressure to the bleeding wound.

- Use a sterile pad or piece of material to apply the pressure over the wound.
- A bandage can also be used to keep the pad in place.

Step 3. Raise the injured area.

- If the wound is on a limb (arm, leg), raise it in a supported position to reduce blood flow to the injured area.

Step 4. Keep the patient comfortable and calm.

- Even if the injury involves the arm or upper part of the body, the patient should rest for at least 10 minutes or until the bleeding is under control or has stopped.

Step 5. Seek medical assistance if bleeding is severe and don't want to stop.

What must you do if blood leaks through the pressure pad and bandage.

- Apply a second pad over the first.
- Don't remove the first pressure pad and bandage.

What must you do if a foreign object is embedded in the wound.

- **DO NOT REMOVE IT.**
- Apply padding on either side of the object and build it up to avoid pressure on the foreign object.
- Hold the padding firmly in place with a bandage or folded triangular bandage.

How do we stop a nose bleed.

Apply firm pressure.

- The patient needs to hold the head well forward and breath through the mouth while pinching the entire soft part of the nose for 10 – 15 minutes.
- Let the patient sit down and at total rest until the bleeding stop.
- If the bleeding doesn't stop after 15 minutes seek medical help.
- Once the bleeding has stopped tell the patient not to blow their nose for a hour because this may restart the bleeding.

How do we treat an abrasion (graze).

- Gently clean with water.
- If there are pieces of gravel embedded in the wound, ask the patient to try and remove them or use a tweezer to remove the particals.
- Dry the area well by blotting with gauze swabs.
- If a protective dressing is necessary, apply anon-adherent sterile dressing and fix it in place with a bandage.

Lesson 1

1. Answer True or False.

- | | |
|---|---------------|
| a. Bleeding is not life threatening. | True or False |
| b. To stop bleeding you must apply direct pressure. | True or False |
| c. Apply a bandage to keep the dressing in place. | True or False |
| d. The injured area must be raised. | True or False |
| e. Let the patient walk to calm him. | True or False |
| f. Always use disposable gloves to protect yourself from any contact with the patients blood. | True or False |
| g. If a foreign object is embedded in the wound remove it slowly not to hurt the patient. | True or False |
| h. If blood leaks through the pressure pad you must apply a second pressure pad and bandage over the first layer. | True or False |
| i. A patient with a bleeding nose must sit down until the bleeding stop. | True or False |
| j. If a nose bleed doesn't stop after 15 minutes you must go to a doctor. | True or False |
| k. After a nose bleed has stopped don't blow your nose for a hour. | True or False |

2. Number the picture in the correct order of treatment.

3. Complete the table.

Spurting _____	_____, slow flow	Slow, _____ flow.
Pulsating _____	_____ red colour	
_____ red colour		

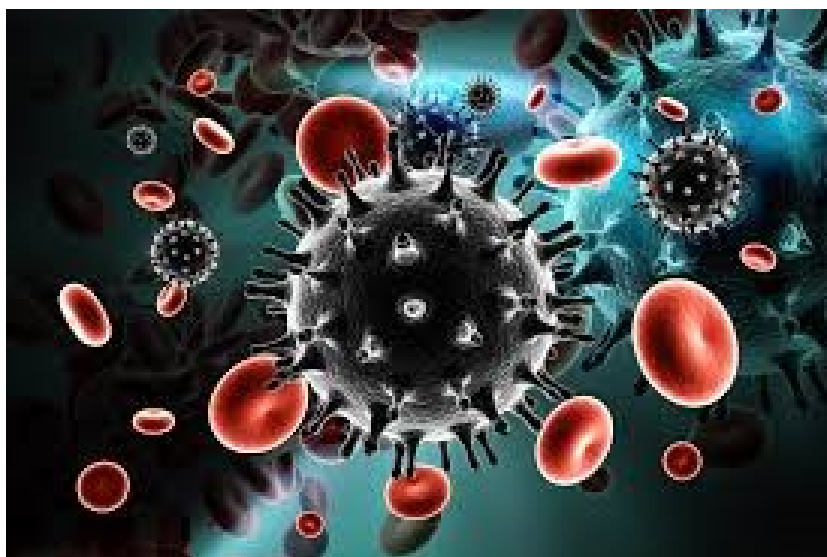

DEMONSTRATE THE NECESSARY STEPS TO BE TAKEN TO PREVENT TRANSMISSION OF DISEASES OR NON-INFECTIOUS DISEASES

AIDS IN THE WORKPLACE

Important information

AIDS (Acquired Immune Deficiency Syndrome) are caused by HIV (Human Immune Deficiency Virus) which destroys the body's natural immune system to fight off diseases. AIDS is a worldwide problem and does not discriminate between groups, race and social-economic status of a person. Over the next ten years, both the number of people infected with the virus and the number of people suffering from aids are expected to increase enormously. The AIDS pandemic threatens the fundamentals of the labour market and therefor educating people are of great importance to ensure a healthy work force.

The HIV Virus.

Remember AIDS has no cure.

How can you get AIDS?

The most common methods of transmission of HIV are:

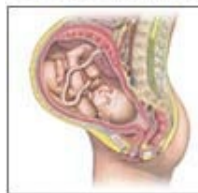

Unprotected sex with an infected partner

Sharing needles with infected person

Almost eliminated as risk factors for HIV transmission are:

Transmission from infected mother to fetus

Infection from blood products

ADAM.

How can you prevent getting AIDS?

Ways to prevent getting infected with HIV/AIDS:

Abstinence

Be faithful

Condoms

Don't share needles

PERSONAL HYGIENE:

PERSONAL HYGIENE is of great importance in a salon. It is essential to prevent the spread of infectious diseases and because your client wants a therapist with high hygiene standards !!!

LESSON 12:

Date: _____

Masego comes into the salon looking very untidy – her hair is a mess, her make-up is too heavy, her clothes are the same ones she was wearing yesterday and she does not smell very fresh.

Masego and her friend Ronnie went to a new club and got home very late. They stayed up the whole night talking and only slept on the floor for about two hours. They had a great time but Masego had to sleep in her clothes !

Do you think Masego is fit for work the next day?

Masego says her clothes are a bit crumpled and smelly but no-one, she will change before she goes out again, she is meeting another friend.

What would you say to Masego if you were in her boss? What do you need to tell her about her personal hygiene in the salon?

PREVENTING BODY ODOUR

Antiperspirant

Reduces the size of the pore so we sweat less

As a PROFESSIONAL you work closely with clients and salons can be warm because of facial steamers or hair dryers.

BACTERIA likes warm conditions – if you are hot and sweaty, body odour can occur!

IT'S NOT A PLEASANT SMELL

So you need to take a daily bath or shower and use **ANTIPERSPIRANT** and **DEODORANT**.

The difference between an antiperspirant and a deodorant?

- A deodorant acts as a mild antiseptic to mask the odour but not reduce the sweating
- An antiperspirant reduces sweating

Deodorant

It is similar to an antiseptic because it stops the growth of bacteria

Anti-septic comes in different forms – in a roll on or an aerosol bottle. When you develop an allergic reaction – STOP using the product !

ORAL HYGIENE

Bad breath is horrible! the causes are

- ♥ Food being stuck between the teeth
- ♥ Digestive problems (stomach problems)
- ♥ Not brushing your teeth
- ♥ Smoking

To AVOID bad breath, you must

- ♥ brush your teeth at least twice a day
- ♥ visit the dentist regularly for check ups
- ♥ use anti-septic mouthwash or dental floss to remove food
- ♥ avoid eating garlic or strong-smelling food

CARING FOR YOUR NAILS AND HANDS

Your hands are very IMPORTANT as a beautician; they are the tools of your trade.

Cross-infection

Transfer of germs and

bacteria through poor

hygiene

Your nails are always in view, so make sure they are clean throughout the day.

Take time to care for your own nails and keep them short so you don't scratch your clients.

BACTERIA grows under DIRTY nails & LONG or BROKEN nails can scratch your client and spread INFECTIONS.

Any cuts or abrasions should be kept covered to prevent **CROSS-INFECTION**.

IMPORTANT THINGS TO REMEMBER ARE:

Dermatitis

Inflammation
of the skin

- ♥ Wash your hands before working on your client or before eating food
- ♥ Nails should be kept clean and well manicured
- ♥ Always wear protective gloves when using chemicals; this reduces the risk of **DERMATITIS**

CLOTHES AND JEWELLERY

Most salons insist that you wear a uniform and an apron – your clothes should be comfortable to wear.

Too much jewellery can catch in your client's hair – it is also a place for BACTERIA to grow and cause **CROSS-INFECTION**

- ♥ Washed and clean clothes should be worn each day
- ♥ Wear cotton-rich clothes, this allows air to flow through and they absorb perspiration (sweat)
- ♥ Avoid dangling jewellery they can scratch your client
- ♥ Avoid belts with loops, as they can get caught on furniture and cause an accident

CARING FOR YOUR FEET

YOU are on your feet for long hours every day, shoes should be COMFORTABLE, CLEAN and SMART

NO HEELS !

- ♥ I'm sure you all wash your feet regularly, but do you dry them properly in between your toes?

Warmth and sweat encourages the growth of bacteria.

- ♥ Avoid open shoes in case you drop a sharp object like a scissor or spill hot wax on your toes as this can lead to accidents
- ♥ Use foot powder as this will absorb perspiration (sweat)

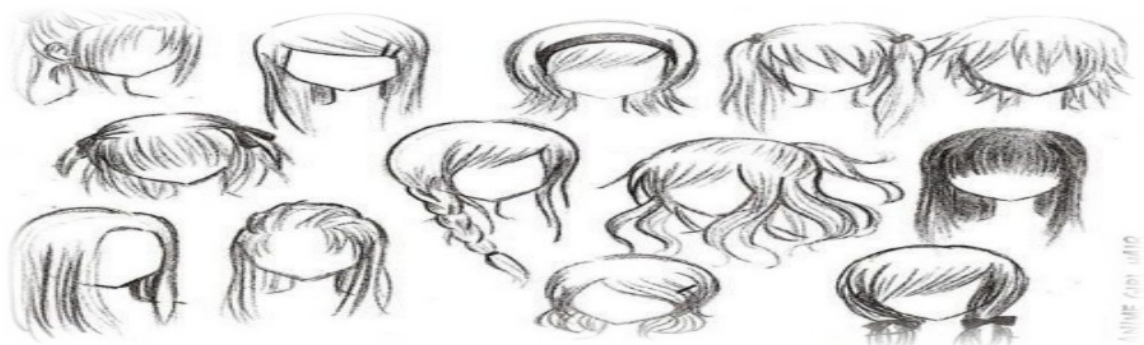

CARING FOR YOUR HAIR

You are a WALKING ADVERTISEMENT for your profession!

Keep your hair clean, in a good condition and styled

Long hair should be tied up and kept out of your face as it can cause **CROSS-INFECTION** between you and your client

Do not use other therapist UNSTERILISED equipment on your hair as it can be contaminated

LESSON 13:

DATE: _____

1. What causes body odour?

2. What should you do to avoid bad breath?

3. What is dermatitis?

4. Why should you always have short fingernails?

5. Name five (5) things to think about concerning healthy feet in a salon?

IMPORTANCE OF PERSONAL HEALTH

IT IS YOUR RESPONSIBILITY TO ENSURE THAT YOUR OWN HEALTH IS NOT NEGATIVELY AFFECTED BY THE SALON

POSTURE

Do you know what the word posture means? Write your own answer.

→ Posture is how you 'hold' yourself when seated, standing or walking.

GOOD POSTURE will help you work longer hours without getting tired

POOR POSTURE looks sloppy and doesn't give your client a good impression of you

POOR POSTURE leads to tiredness or injuries as your body weight is not evenly distributed

How would you describe good posture? Write down three (3) things that indicate good posture.

→ good posture include standing up straight with your shoulders back, Tummy pulled in and your chin forward

Keep your back straight when sitting down not 'folding' in the middle

Standing on both feet with your posture being balanced

CLEAN GENE Word Hunt

Hunt through the puzzle to find the following words. Circle each one when you find it as shown below. Words can be spelled out in many different directions: horizontally, vertically or diagonally — even upside down.

Germ	Cut	Cough	Virus	Fever	Fungi
Disease	Sanitize	Clean	Sick	Exercise	Organism
Sneeze	Bacteria	Aches	Hands	Soap	Hygiene
Wash	Airborne	Healthy	Skin	Microbe	Transmission
