

BEAUTY AND NAIL TECHNOLOGY

YEAR 3 – TERM 1

WORKBOOK

NAME:

Safety, security, housekeeping

Activity 1

Introduction

Ensure your actions reduce risks to health and safety.

- Identify and report potential hazards in the workplace
- Assess and reduce risk to health and safety
- Control the salon environment
- Carry out emergency procedures
- Carry out sanitation and sterilization procedures
- Carry out security procedures
- Understand workplace policies relating to health and safety

Although the employer is legally accountable for the health and safety of people working in or visiting the salon, it is the staff who; on a day to day basis, are at the forefront of business operations. All employees have a professional responsibility for ensuring high standards of health and safety. The standards should be set out in the salons policies and procedures.

Identify and report emergency situations.

Occupational health and safety generally focuses on the prevention of illness, injury and damage to people. However unplanned incidents can and do occur. Such emergencies should be planned for in advance. These plans also need to be periodically tested to ensure that an adequate response occurs during an actual emergency.

What is an emergency?

An emergency may be defined as a dangerous situation that requires sudden and urgent action. Your work environment determines the types of emergencies that are most likely.

Examples of emergencies that occur in the Beauty Salon:

- Power failure or electrical hazards
- Fire
- Armed hold-up
- Someone requiring urgent medical attention
- chemical spills / toxic fumes
- Flood

Your understanding of emergency procedures can assist in the prevention of loss of human life and property.

Evacuation procedures

The implications of not following correct emergency procedures can be deadly serious. It is important that whatever procedure has been put in place by your organization or workplace is followed.

Evacuation is usually required in the case of fire, widespread smoke, hazardous substances spillage or theft or robbery

Example of evacuation procedure:

- As soon as you are advised to evacuate:
- Stop what you are currently doing.
- Keep calm.
- Exit the building as quickly as possible.
- Assemble at the pre-determined evacuation area.
- A head count will be conducted.
- Return to building when officially authorized to do so.
- In an evacuation the Evacuation Warden is in charge. Do everything they tell you to do!

Controlling the salon environment

The salon must offer the same high standards of hygiene, safety and comfort throughout the working day. This is to ensure that all clients receive the same quality of service, whatever time of their appointment. At all times, the salon must be:

1. Clean and tidy
2. Maintained at reasonable temperature
3. Well ventilated
4. Well lit

Fire safety

A fire can close the business temporarily or permanently, destroying important papers and records at the same time. It can cause extensive damage to property and result in serious injuries or even death. Everybody in the business must know how to prevent a fire from happening and how to deal with a fire if one happens. This is described as **fire safety**.

The common causes of fire are:

Electrical faults

Smoldering cigarette ends

Open flames

Matches

Heaters

All electrical work in the salon should be undertaken by a qualified electrician. Ideally, smoking should not be allowed anywhere on the business premises. Main suppliers of flammable materials should be stored well away from sources of heat in a closed, metal cupboard. Loose paper and cardboard should not be left lying around.

What you must do:

- Keep all flammable products should be kept away from sources of heat
- Avoid overloading electrical circuits
- Never leave the flex of an electrical heater trailing where it could be tripped over
- Switch off and disconnect electrical appliances after use
- Do not smoke or allow smoking except in specially designated areas
- Avoid placing towels over electric or gas heaters
- Use a safety lighter in preference to matches for lighting a gas heater
- Before leaving at night, check that bins are emptied and that all electrical appliances are unplugged.

Fire emergencies

The ability of fire to ignite and spread makes it one of the most feared emergency incidents a person may have to face. More people suffer from the effects of smoke inhalation than from the flames and heat of the fire itself.

Even with the best intentions of prevention, fires can still occur in the workplace.

Three factors are needed for a fire to occur:

- Fuel: any solid, liquid or gas that can burn
- Oxygen: from the air and also from chemical reactions
- Heat: flames, sparks, cigarettes etc.

If you discover a fire, remember the six steps to safety:

1. Sound the alarm immediately
2. Tell everyone to get clear
3. Advise the fire brigade
4. Fight the fire - if you have been trained to do so
5. Evacuate the building
6. Do not re-enter the building until the all clear has been given by the fire brigade.

For electrical fires, remember to turn off the power.

FIRE-FIGHTING EQUIPMENT

A fire should be detected and tackled within a few minutes of it breaking out. Employees should be trained in the correct use of fire-fighting equipment. This may be used to put out a small fire but, more usually, it helps to keep control of the fire until the fire brigade arrives.

The local fire authority will provide advice regarding the best locations and types of equipment for the business.

Fire extinguishers

There are different types of extinguishers for different types of fires. Using the wrong type could make the fire worse.

REMEMBER

There are four classification of fire:

Class A: Fires involving solid material such as paper, wood, hair etc.

Class B: Fires involving liquids such as petrol, paraffin etc.

Class C: Fires involving gases such as propane, butane.

Class D: Fires which involve metals (not normally encountered in salons).

DIFFERENT FIRE-FIGHTING

Type Fire Extinguisher	CLASS A	CLASS B	CLASS C	CLASS D
	Combustible materials (e.g. paper & wood)	Flammable liquids (e.g. paint & petrol)	Flammable gases (e.g. butane and methane)	Flammable metals (e.g. lithium & potassium)
Water	✓	✗	✗	✗
Foam	✓	✓	✗	✗
Dry Powder	✓	✓	✓	✓
CO2	✗	✓	✗	✗
Wet Chemical	✓	✗	✗	✗

Fire blanket

A blanket is used to smother a small, localized fire or if a person's clothing is on fire.

Bucket of sand

A bucket of sand is used to soak up liquids that are the source of a fire and also to smother the fire.

shutterstock.com • 87695065

Water hose

Hoses are used to extinguish large fires, for example those fueled by paper. Buckets of water may be used to extinguish larger fires, for example those fueled by paper. Buckets of water may be used to extinguish a small fire fuelled by paper.

EVACUATING THE SALON

Once it has started, a fire can rip through the premises in minutes. The most important thing is to get away from the fire to safety. This means getting everybody out of the salon, even if they are in middle of a treatment. If it is safe to do so, a designated person should take the appointment book and visitor's book with them as they leave the building. When everybody is outside, they should gather at an assembly point. Their names should be checked against the names in the books. The emergency service must be told who is missing.

What must you do:

- ✓ **Never ignore the smell of burning: if there is a fire, the sooner you know the better.**
- ✓ **Sound the fire alarm if there is one**
- ✓ **Know where the fire-fighting equipment is kept and how to use it**
- ✓ **Know the emergency evacuation procedures for the salon**
- ✓ **Know where to assemble outside the building on evacuation**
- ✓ **Check for injuries and continue to take care of your client and others while you wait for the emergency service to arrive**
- ✓ **Know how to call the emergency services**
- ✓ **Find out where the nearest phone is**

CALLING THE EMERGENCY SERVICES

It is very important to try not to panic and to speak clearly and not too fast when calling for help from emergency services.

What must you do:

1. Call the fire brigade – **10111 / 10177**

2. Tell the operator you want the fire department
3. Give your telephone number and location. If you are in a public telephone, the details will be displayed
4. Give the full address of the emergency and other relevant details of the fire
5. Report any injuries
6. Listen carefully to any questions you are asked and answer them calmly
7. Listen carefully to any instructions you are given
8. After the call, replace the receiver and wait with others, in a safe place, for the fire service to arrive.

ELECTRICAL SAFETY

All electrical items must be tested for electrical safety at least once a year by a qualified electrician. Records should be kept of the tests. The main risks associated with unsafe electrical equipment are electric shock and fire.

Electrical shock

If a fault develops in an electrical appliance, the outer casing may become live. This may cause anyone using or touching the appliance to receive an electric shock. The current will pass straight through the body from the mains to earth, contracting the muscles in its path. The muscles may contract, causing breathing and the heart to stop. A mild electric shock is unpleasant. A severe electric shock can be fatal.

Fire

A fire can occur as the result of poor electrical maintenance, for example faulty or damaged flexes, plugs and switches; also, if the electrical circuit becomes overloaded. This can happen when two or more machines are being operated from one socket using an adaptor. If the correct fuse is not fitted, the socket may become overloaded with current and get dangerously hot.

Electrical Precautions

Basic safety checks should be carried out before using any piece of electrical equipment. And stored machines should be handled carefully and stored between treatments

When using any electrical appliance or piece of equipment, always check that:

Cables and flexes are in good conditions with no signs of fraying or worn insulation

There are no trailing flexes that could cause someone trip

The plug is intact; if cracked or broken it must be replaced

There are no loose connections; leads should feel firmly attached and switches should be secure

The appliances is on a level and stable base

The appliance is switched off and disconnected from the mains after use

The appliance is left clean and stored properly

Cables and flexes are wound up and secured to avoid them becoming damaged in between uses

Sockets are not overloaded or broken

Identify and reporting faulty equipment

Once you have been trained on a piece of equipment, you will know the characteristic features that show the machine is working properly. Having carried out the basic safety checks, you should always test the equipment on yourself in front of the client. This is particularly important if the client has not had the treatment before and is feeling a little nervous. If anything feels, sound or appears, smells or appears wrong to you when testing the equipment, do not proceed with treatment. Take the faulty equipment out of use immediately and report supervisor.

Dealing with waste

Waste should be dealt with promptly. It should not be allowed to build up on trolleys and work surfaces.

What must you do:

- Dispose of waste in a covered bin
- Remove salon waste daily
- Place contaminated needles in a yellow 'sharps' container: when full, this should be disposed of by reputable hygiene disposal company, as advised by the local environmental health department
- Clear away and dispose of broken glass carefully after an accident

When dealing with broken glass

What must you do:

- Clear it away immediately
- Try and avoid handling broken glass; use a dustpan and brush
- If you have to touch broken glass, wear strong gloves to protect your hands
- Ensure broken glass does not cause injury to anyone else once you have disposed of it; wrap it up securely in several layers of newspaper before placing in a waste bin

Many of the products used in the salon are safe under normal use but can become unsafe if not stored, handled or disposed of properly. This is because of the chemical ingredients they contain, which require particular conditions to keep them safe. Specific hazard warning symbols and guidance phrases have been introduced for labeling products. These show, at a glance what dangers are. Products may be very toxic, toxic on contact with skin, by inhalation or if swallowed.

Hazardous substances

Hazardous substances may enter the body by inhalation through the nose, by ingestion through the mouth, by absorption or penetration through the skin and via the eyes.

What must you do:

- Know the potential hazards in your salon and carry out the necessary safety precaution
- Always read labels and make sure the guidance on them does not get worn off or covered
- Read any leaflets provided by manufacturers and keep them for reference
- Check with your supplier if you are unsure about the product
- Mix products in a well-ventilated area
- Try not to breathe in dust, vapor or spray
- Wear protective clothing where necessary
- Dispose of waste chemicals and unused mixtures safely: small amounts may be rinsed away down the sink to dilute and remove them
- Ensure that damaged and leaking containers are handled with care when disposing of them

As with all beauty products, substances that are hazardous should be stored in an area which is:

Secure

Inaccessible to children and other unauthorized people

Dry and well ventilated

Away from sources of ignition

Away from sources of ignition

Cool (room temperature or slightly cooler)

Away from direct light

DATE _____

Activity 1 - Safety, Security and Housekeeping

Question 1

There are four classifications of fire, indicate if it's a Class A, B, C or D class fire.

1.1 Class : Fires involving liquids such as petrol, paraffin etc.

1.2 Class : Fires which involve metals (not normally encountered in salons).

1.3 Class : Fires involving solid material such as paper, wood, hair etc.

1.4 Class : Fires involving gases such as propane, butane.

[4]

Question 2

Name the six safety steps to remember when discovering a fire.

1.

2.

3.

4.

SANITATION

Introduction

The law states that every workplace must be a fully hygienic environment. This is extremely important in an establishment such as a beauty salon that sees many different people passing through every day.

Working in a salon environment also means that you are exposed to many different clients and performing treatments everywhere from their face to their fingernails and toenails, to their most intimate areas.

With all of this in mind as a salon owner, it is very important that excellent salon hygiene and good housekeeping within your business. Not only for your staff but also for your visitors and clients to ensure that your business continues to run effectively and nobody's health is put at risk.

Why is it important to maintain standards of hygiene?

Maintaining personal hygiene is necessary for many reasons; personal, social, health, psychological or simply as a way of life. Keeping a good standard of hygiene helps to prevent the development and spread of infections, illnesses and bad odours.

Who is responsible for maintaining a hygienic salon?

It's the responsibility of everyone working in your salon. Ensure that all hygienic responsibilities, such as sterilising the implements or keeping the floor clean after a client had her nails filed.

You can create a daily duties checklist to assign tasks and to keep record of when each job has been carried out and by whom. This includes all areas from the salon floor, to the toilet, the kitchen, the reception area and everywhere in between. This will ensure that nothing can be forgotten whilst keeping your salon running effectively.

Keeping salon furniture clean

It goes without saying that your salon premises should be kept clean and hygienic at all times. Treatment areas with a high volume of daily use such as beauty beds and chairs, should be thoroughly cleaned between each client or new covering should be placed over the surface.

Make sure you use the correct disinfectant product. Products with alcohol can damage your vinyl or PVC covers.

Avoiding cross-contamination

It is really important that any equipment is thoroughly cleaned between usage, and it is very important that the procedure is not shortcut.

Tools that come in to contact with multiple clients such as your nail cutter, cuticle nipper should be repeatedly cleaned between usages and be kept in a clean and dry condition when they are not required. Towels and other linen should also be washed regularly as stained, used towels not only look unsightly but could also harbour germs if left lying around damp.

Keeping the salon floor clean

With a heavy flow of footfall, the floor of your salon is a hive of activity and therefore needs to be remain clean at all times. At the end of each day, ensure that you undertake a thorough floor clean, ready for the next day.

Personal hygiene in a salon

It goes without saying that it is your duty to ensure that your staff keep themselves clean when undertaking treatments from client to client.

Simple practices such as ensuring hands are clean and uniforms are free of any nail shaving.

Keeping on top of salon hygiene isn't tasking and is a serious practice to ensure that your salon compiles with the necessary regulations. It also ensures that your business not only looks more appealing but builds trust with your clients as a sign that pays attention to detail.

REMEMBER !

Sanitize and sterilize is not the same thing!

Sanitizing is a technical term that means a certain allowable amount of microorganisms remain, and sterilization is removing **ALL** of them.

Sanitation

- ✓ All equipment must be sanitised after each client.
- ✓ All tools and equipment should be washed in soap and water, and dried properly.

Sterilisation

- ✓ Tools and equipment should be properly sanitized and the placed in the sterilisation and left in for the required duration to kill or inactivate all disease-causing bacteria, spores, fungi and viruses

Tools that you will need for sanitation:

Sanitise equipment →

- Any antibacterial soap
- Water
- Paper towel

Methods of Sanitation / Sterilization procedures:

1. Wet Sterilization

The organisms are destroyed through moist heat. This results in the death of the organisms. Moist heat method is used for heat sensitive materials. Through wet sterilization, the most resistant of the spores require a temperature of 121°C for around half an hour. It is a more effective method when compared with dry heat sterilization. This can be supported by the fact that through wet heat, sterilization can be achieved at lower temperatures in a shorter duration.

PROCEDURE:

- ✓ Prepare the solution.
- ✓ Tools are completely submerged.
- ✓ Cover with a lid to prevent contamination.
- ✓ Before submerging, wash with warm soapy water and rinse thoroughly.
- ✓ After removing tools from the solution, rinse and dry with a clean towel and store in a clean dry cabinet.

2. Dry Sterilization – UV cabinet sterilizer

Dry heat is used for sterilizing different materials. Heated air is used in this process. As compared to the wet sterilization, the temperature in this method is higher. The temperature is usually higher than 180 °C.

PROCEDURE:

- ✓ Airtight cabinet containing fumigant.

- ✓ Tools are placed in a cabinet until ready for use.
- ✓ Fumigant= 1 tbsp Borax + 1 tbsp Formalin.
- ✓ Place on a tray at bottom of cabinet.
- ✓ Vapours will form inside the cabinet sanitizing the tools.

DATE _____

Activity 2 – Sanitation

Question 1

Complete the following Questions:

1.1 What is the difference between sanitizing and sterilizing?

Sanitizing:

.....

[2]

Sterilizing:

.....

[1]

1.2 Name the three different equipment that is needed for sanitizing:

1.

2.

3.

Anatomy of the hand, Arm and Foot

Bones of the hands and forearms

The hand and wrist are composed of **29** bones. The bones, muscles and joints are responsible for the various movements of the hands.

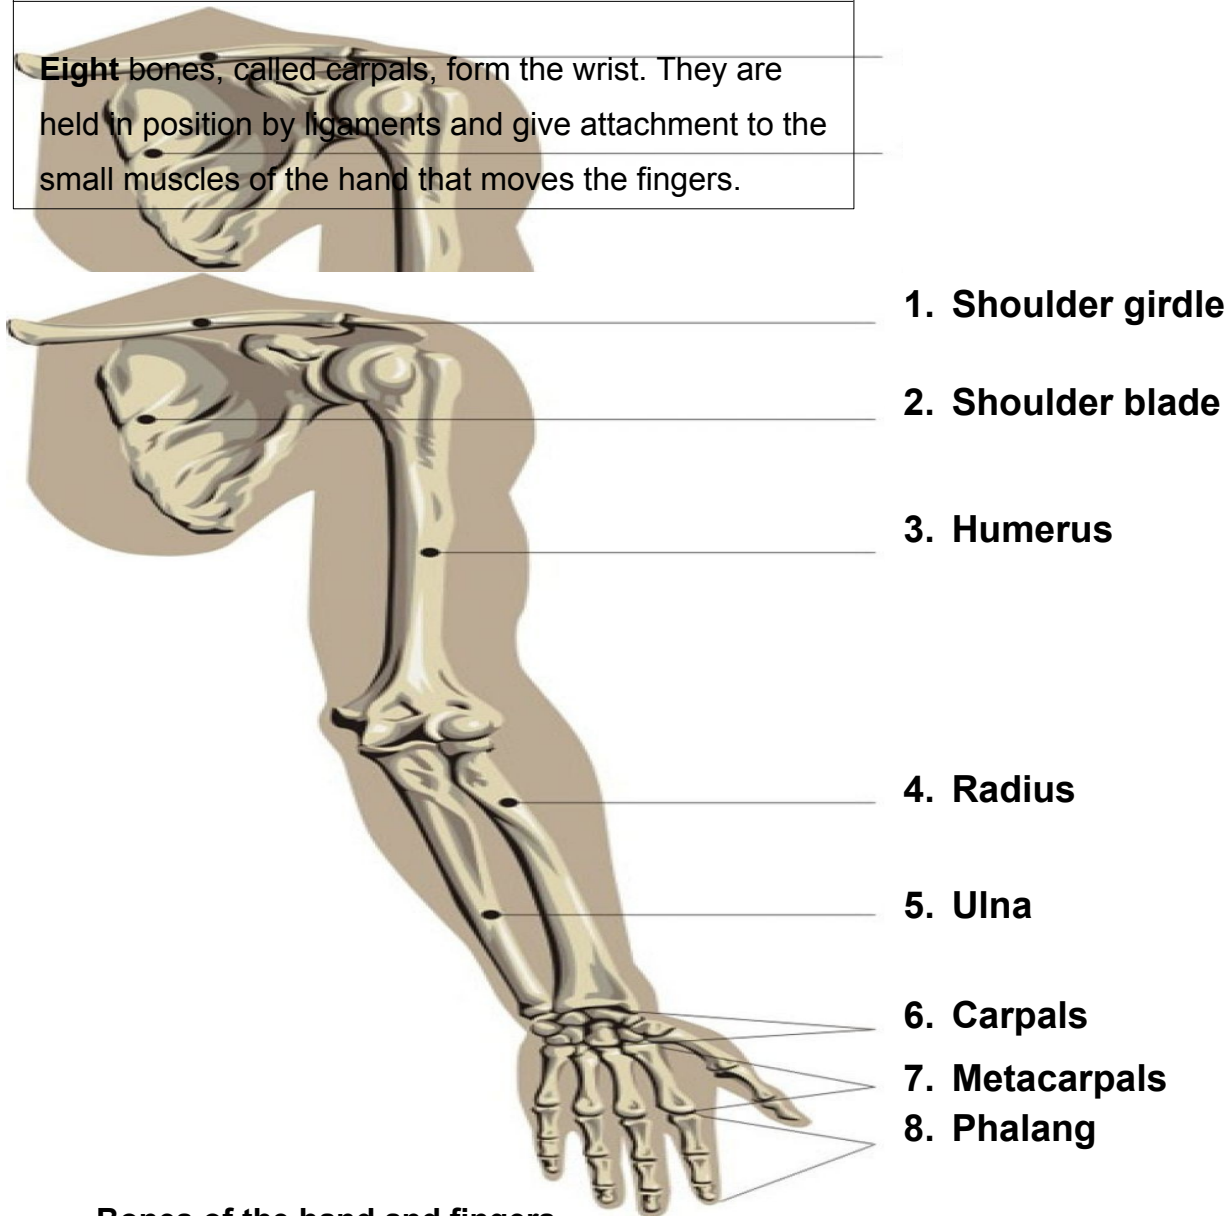

1. Bones of the forearm:

The forearm contains **two** bones, called **radius** and the **ulna**.

The radius is the bone on the thumb side of the forearm and the ulna is the bone on the little finger side of the forearm.

2. Bones of the wrist:

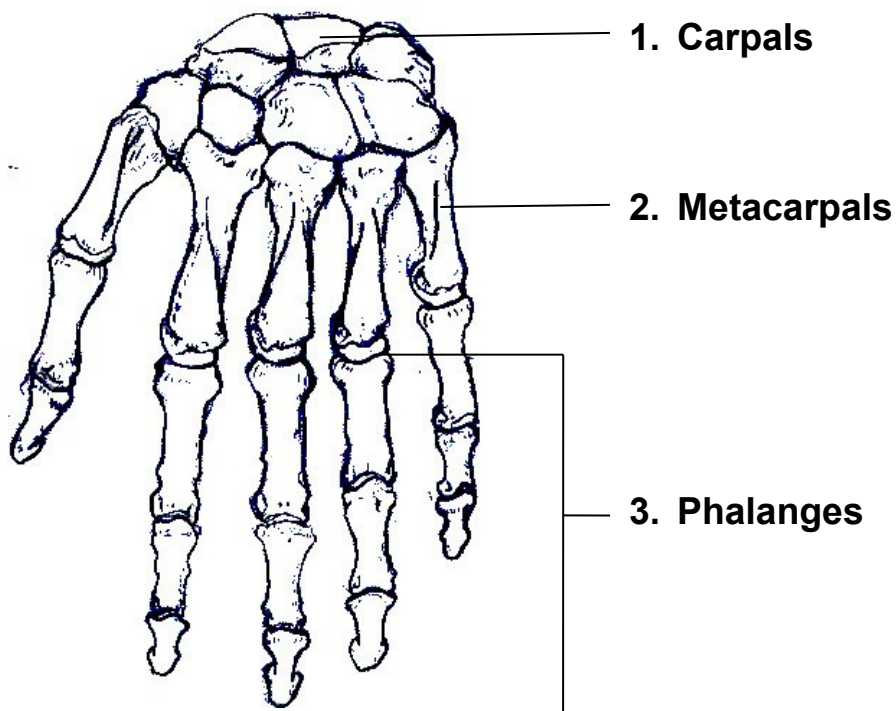

Eight bones, called **carpals**, form the wrist. They are held in position by ligaments and give attachment to the small muscles of the hand that moves the fingers.

Bones of the hand and fingers

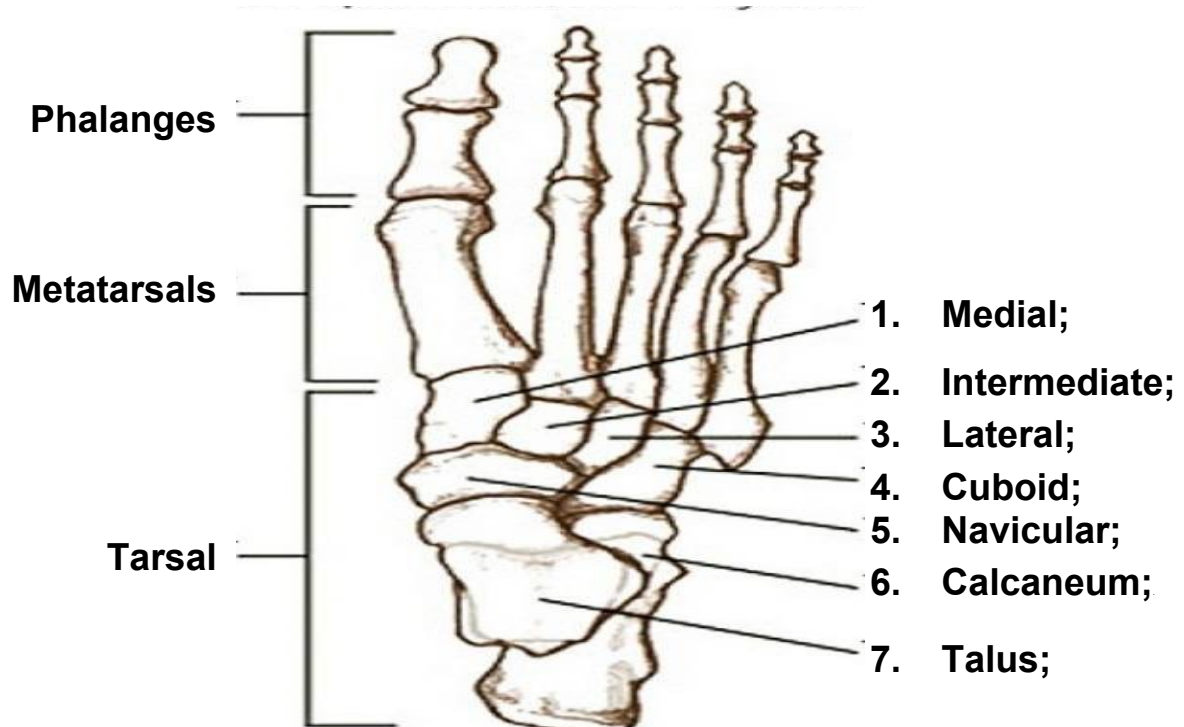

The palm of the hand is made up of **five bones** called the

There are **14** finger bones called phalanges – **Three in thumb.**

Bones of the foot

The foot combines the functions of movement and support. It is made up of a large number of closely articulating small bones, formed into arches by their ligament connections to combine strength and flexibility. There are **26** bones in the foot – **7** Tarsal, **14** Phalanges and **5** Metatarsal bones.

DATE _____

Activity 3 - Anatomy of the Hand, Arm and Foot

Question 1

Complete the following questions:

1.1 The forearm contains two bones, called and the

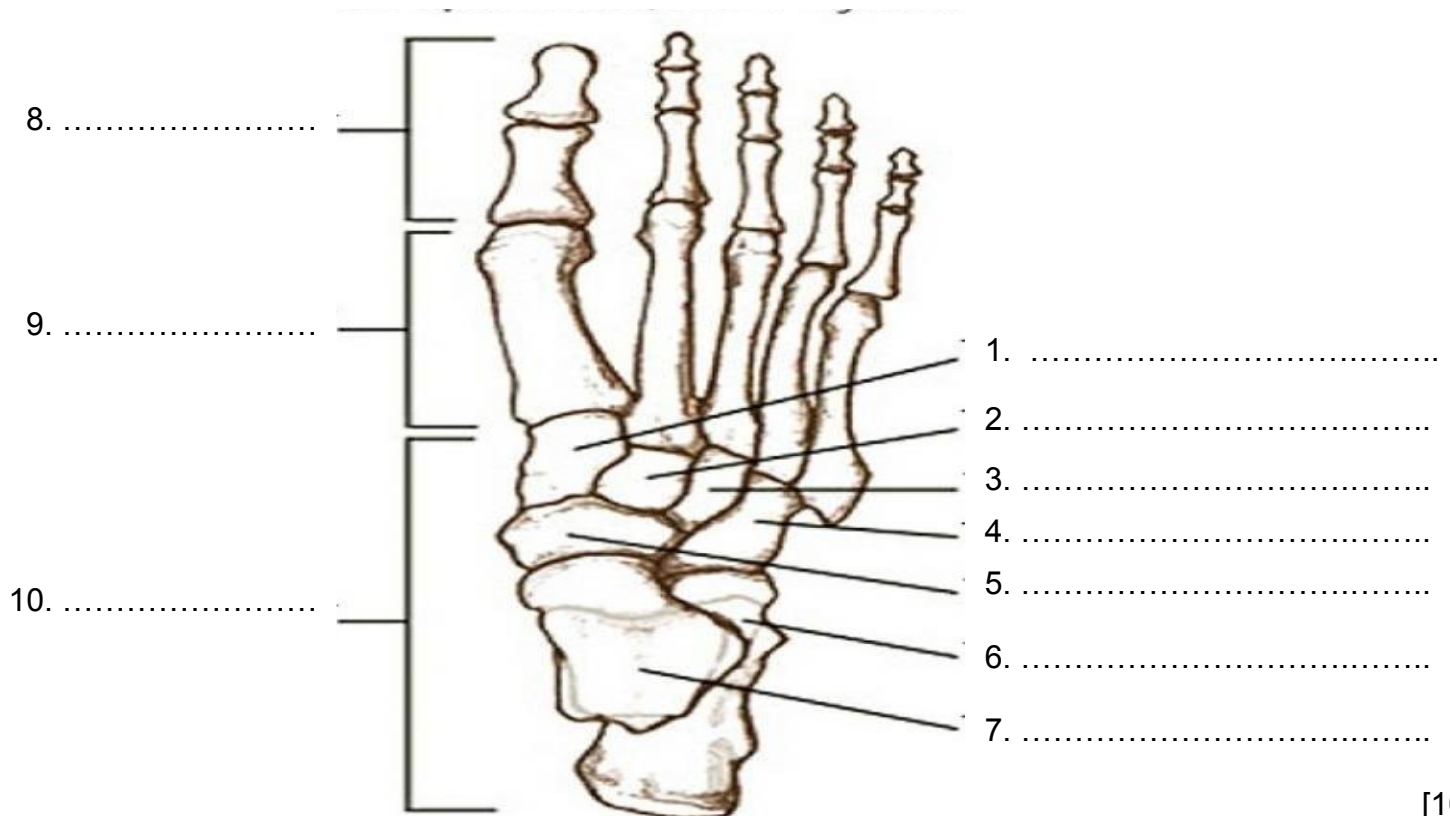

1.2 bones, called carpals, form the wrist. They are held in position by ligaments and give attachment to the small of the hand that moves the fingers.

1.3 There are bones in the foot

Manicure

Introduction

The purpose of a manicure is to beautify the hands and nails and to keep the nails in an immaculate condition. As the appearance of the nails form an integral part of a good groomed appearance.

Manicure service PRODUCTS needed:

Products needed for a manicure service	
Products	Function
Nail-enamel remover	Removes nail polish quickly and effectively
Cuticle remover	Softens and release dead cuticle cells
Cuticle cream	Keeps cuticle soft and flexible Prevents hangnails Promotes growth of nails Softens and releases cuticle cells on nail plate
Hand treatments	Soften skin of hands Protect skin against chemical and detergents Are used as a massage medium
Nail and cuticle oils	Soften and lubricate skin around the nails Softens cuticle
Paste polish	Used with buffer to even out ridges Adds a sheen to nails
Nail enamels	Add colour to the nails Protect the nails
Base coat	Protects nails plate against colour stains Prolongs life of coloured nail enamel Minimises irregularities in nail plate
Top coat	Prolongs lie of coloured nail enamel Adds lustre to colour
Nail varnish thinners	Used to thin thickened nail varnish. Never use nail varnish remover as a thinner
Quick-dry	Speeds up the drying process of enamel – may be part of top coat
Nail strengthens	Prevent nails from becoming brittle and fragile Add strength to nail plate
Scrubs or exfoliators	Soften and remove dry, hard skin, calluses or cuticle Improve blood circulation Leave skin soft and even-textured Smooth out cracks

Manicure service IMPLEMENTS needed:

Implements needed for manicuring	
Implements	Function
Orange-wood stick, covered with cotton wool	• To loosen cuticle • To work around the nail • To apply cosmetics • To push back cuticle
Emery boards	• To shape nails • To smooth free edge of nail
Cuticle nipper	To nip off hangnails or torn pieces of cuticle
Nail brush	• To clean nails and fingertips • To even out surface of nails
Nail buffer	To buff or polish nails
Nail scissors	To shorten the nail length, if required

Manicure service EQUIPMENT needed:

Equipment needed for manicuring	
Equipment	Function
Manicure table	On which to perform manicure: must be big enough for products, materials and client's hands to rest on
Chairs	A chair for the client and a chair for the manicurist
Good lighting	For clear vision
Cushion	An armrest for the client
Wet sanitiser	To keep metal instruments in
Glass containers	For client's jewellery and cotton wool
Electric heater	To heat up oil for oil manicure
Waste bin	To hold discarded and used materials

Manicure service MATERIALS needed:

Materials needed for a manicure	
Materials	Function
Absorbent cotton wool	To apply cosmetics to the nails
Soapy cleaner	For finger bowls, to clean hands

Finger bowl	To soak hands in
Warm water	For finger bowl
Sanitised towels	To dry hands, for hands to rest on
Antiseptic	In finger bowl, to use in case of minor injuries
Disinfectant	To sanitise implements, to disinfect manicure table
Spatula	To remove cream from jar
70% alcohol	Used in glass container to sanitise instruments
Nail – Mending kit	To repair broken, split or torn nails

Manicure Preparation:

- Clean nail table with disinfectant
- Place fresh soaking solution to the left of the client on the nail service table, near the technician
- Clean, disinfect and place the correct nail service implements on the nail table
- Review and arrange the products needed conveniently in order of use.

CAUTION

When buffing the nail plate, applying excessive pressure or buffing too long can generate excessive and painful heat on the nail bed. If your client is feeling heat or burning, lighten the pressure and lower the speed of the buffing.

REMEMBER

Always file the nails in a manicure before they are soaked, as water will absorb into the nail plate. Making it softer and more easily damaged during filing.

Manicure procedure:

1. Wash and sanitize your own and your client's hands and nails. Apply a topical antiseptic.

2. Remove any polish on the nails. Use polish remover and cotton.

3. Analyse the skin and nails thoroughly for any noticeable diseases or disorders.
Consult with your client about the shape and length of nails desired.

Nail prep:

4. File and shape the nails with an emery board.
 - a. Begin with the little finger on one hand and shape from the outer edge of the nail toward the centre to avoid splitting.
NO ZIG-ZAG FILING!
 - b. Use 2 or 3 strokes on each side of the nail and one longer stroke per side to blend. Round the top of the nail gently.

Cuticle Care:

5. Apply cuticle remover cream to one hand

6. Place the hand in the finger bowl to allow cuticles to soften. Repeat filing, shaping and cuticle care on the opposite hand.

DATE _____

Activity 4 - Manicure

Question 1

Complete the following table by filing in, in Column A whether it's a product, implement or equipment and write in Column B each one's function.

	<u>Column A</u>	<u>Column B</u>
Emery board		
Waste bin		
Finger bowl		
Base coat		
Nail buffer		

[10]

Question 2

Complete the missing words:

service; lighten; manicure; cosmetic; disinfectant

2.1 Clean nail table with

2.2 Always file the nails in a before they are soaked.

2.3 Manicure is the care of the hands and fingernails.

2.4 Clean, disinfect and place the correct nail implements on the nail table.

2.5 If your client is feeling heat or burning, the pressure and lower

the speed of the buffing.

[5]

Pedicure

Introduction

A pedicure is the cosmetic care of the feet and toenails.

As with any professional service, it's important to have your working area, the products, implements and equipment that you will be using in proper order prior to your client's arrival.

Pedicure service **PRODUCTS** needed:

PRODUCTS	FUNCTION
Antiseptic	Reduces bacteria, viruses and fungus on the skin
Polish remover	Dissolves polish
Cotton balls / cotton swabs	Used to apply polish removers and remove lotions from the nail plate
Cuticle remover cream	Loosens dead skin
Soaking solution	Cleans, softens skin and loosen dirt
Foot scrub	Removes dead skin cells
Massage lotion	Is used for relaxation through massage and moisturizes
Foot powder	Dries and deodorizes
Base coat	Evens out nail plate, holds nail colour to nail, prevents pigments from penetrating the nail plate
Liquid polish	Creates a coloured effect
Top coat / Sealer	Protects coloured polish from chipping, fading and peeling
Nail dryer	Aids in fast drying of polish

Pedicure service IMPLEMENTS needed:

IMPLEMENTS	FUNCTION
Emery board	Shortens and shapes toenails
Nail clipper	Shorten toenails
Toe separators	Separate toes during polish technique
Foot file / Paddle	Softens and removes calluses
Cuticle pusher	Pushes cuticles back
Orangewood stick	Loosens debris and is used to apply creams and clean under free edge
Cuticle nipper	Trims cuticles
Foot brush	Cleans nails and removes debris
Cosmetic spatula	Removes cream from jars in an effort to meet infection control guidelines
Cosmetic spatula	Used to separate toes to examine feet for any abnormalities
Foot bath	Allows comfortable soaking of the feet
Disposable towels	Dries feet

Pedicure service EQUIPMENT needed:

EQUIPMENT	FUNCTION
Pedicure table	Provides a place for all equipment, products and implements to be laid out
Service stool	Allows easy access to the client, seat is adjustable
Client's chair	Provides back support and comfort to client during pedicure service

PEDICURE PREPARATION	✓
• CLEAN AND DISINFECT IMPLEMENTS • SET UP EQUIPMENT AND LAY OUT TOOLS ON SANITIZED TABLE • REVIEW AND ARRANGE PRODUCTS IN ORDER OF USE • PREPARE THE FOOT BATH WITH ENOUGH SANITIZING SOLUTION TO COVER BOTH FEET • WASH YOUR HANDS WITH LIQUID SOAP	

Pedicure procedure:

17. Wash and sanitize your own hands.

18. Sanitize your client's feet by spraying each foot with antiseptic.

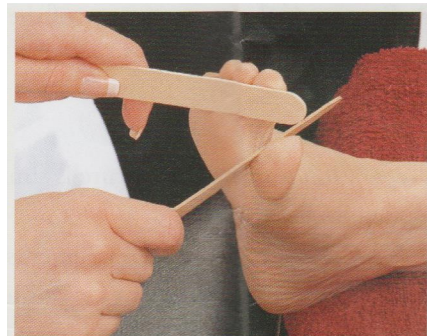

19. Place client's feet in the foot bath and allow to soak for 5 to 10 minutes.

20. Remove clients feet from the foot bath, dry them. Remove any polish with polish remover and cotton.

21. Examine the feet for any abnormalities. Use disposable spatulas to separate toes. If there are no problems, continue service.

6. Trim and file toenails. If nails are too long, use a toenail clipper.

DATE _____

Activity 5 - Pedicure

Question 1

Complete the following table by filing in, in Column A whether it's a product, implement or equipment and write in Column B each one's function.

	<u>Column A</u>	<u>Column B</u>

A specialised manicure and pedicure paraffin service

Introduction

Paraffin treatment is applied after a hand massage, which you will learn in the next section. The benefits of a paraffin treatment are: Relaxation; improved blood supply to the treated area; improved skin texture and colour; increased absorption of chamber of oil; and soothing arthritis pain.

What Is a Paraffin Treatment?

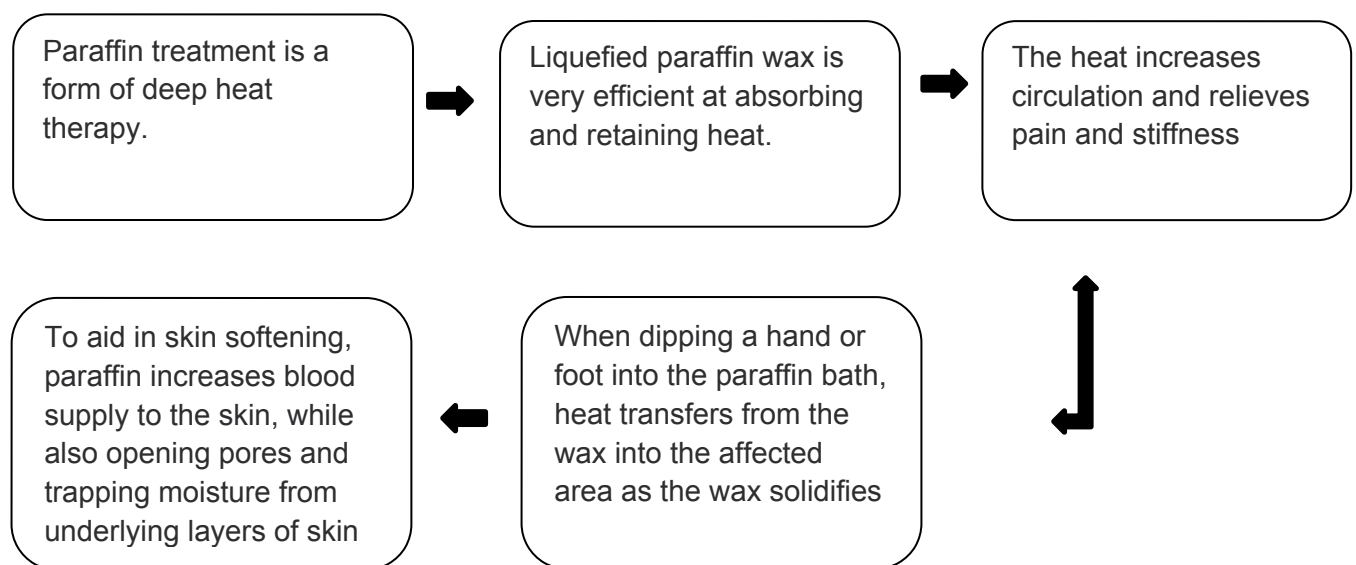

Paraffin treatment uses warm oil-based wax to provide pain relief to hands, feet and sore joints and muscles.

Benefits:

- ♥ Soothes chronic joint pain and relaxes stiff muscles
- ♥ Smooth and soften dry, chapped, rough and scaly skin
- ♥ It can be helpful for chronic skin disorders such as eczema and psoriasis

How does it work:

Different types of workstations for a paraffin treatment:

Products and equipment needed for the treatment:

- ✓ Paraffin bath
- ✓ Paraffin wax
- ✓ Plastic Liners

General Guidelines for all paraffin treatment

- Thoroughly wash and dry the area to be treated. Remove jewellery

- The internal thermostat of the unit ensures that the bath is kept at a safe, medically accepted temperature and that the paraffin will not be too hot

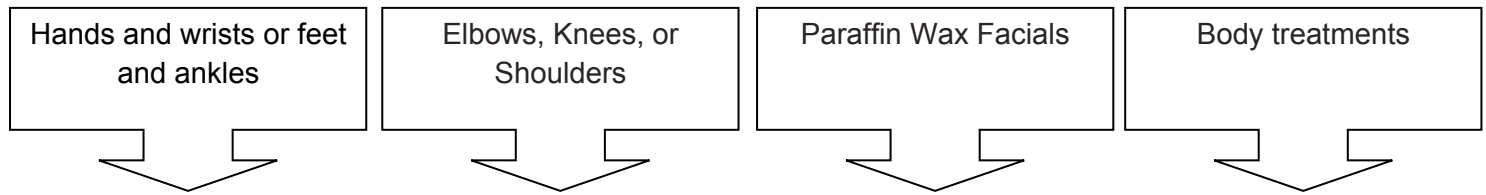

- To test the temperature, dab a small amount on the inside of your wrist. The paraffin will feel warm, but it will not burn

- Discard used paraffin. Do not reheat used paraffin.

Important Hygiene notes for public use of a paraffin bath:

✓	Wash and dry the skin before applying paraffin
✓	Spray the skin with sanitizing spray
✓	Follow all paraffin application instructions.
✓	Discard used paraffin. Do not reheat used paraffin
✓	Except for personal units, use separate units for hands and feet.
✓	Place the units lid on the bath when it is not in use
✓	Clean the bath after every 25 treatments, when paraffin is cloudy

Different paraffin treatments:

Hands and wrists, or feet and ankles procedure:

1. Cleanse hands (or feet) with warm water and soap, and then mist with Sanitizing Spray
2. Apply a light coat of Intensive Hydrating Cream, working into cuticles and dry areas.
3. Slowly immerse the hand (or foot) in the paraffin wax. For the hand, fold fingers slightly apart so that the paraffin surrounds each finger

4. Slowly remove the hand (or foot) and wait about five seconds before redipping.
5. Repeat three to five times. For relief of pain and stiffness, dip up to 15 times
6. To enhance the heat benefit, cover the hand (or foot) with a plastic liner and then slip on an insulated mitt (or boot).

7. Rest for 10 to 15 minutes.
8. To remove, first slip off the mitt or boot. Then wiggle the fingers or toes slightly to loosen the paraffin, and slide the paraffin off together with the plastic liner. Discard the used paraffin and plastic liner.
9. If desired, apply lotion to dry areas.

DATE _____

Activity 6 - A Specialised Manicure and Pedicure Paraffin Service

Question 1

Name any two (2) products or equipment that is needed for a paraffin treatment:

1.
2.

[2]

Question 2

Name the four (4) different paraffin treatments:

1.
2.
3.
4.
