

BEAUTY AND NAIL TECHNOLOGY

YEAR 3 – TERM 3

LEARNER NAME: _____

WAXING

Definition

Waxing is a temporary hair removal technique; wherein hot or cold wax is used to remove hair from the desired area. The wax is applied directly to the skin and then pulled back. The unwanted hair is pulled out along with the wax.

Most popular areas for waxing are:

- eyebrows,
- upper lip,
- pubic area, back,
- arms,
- legs and
- underarms.

Benefits of waxing

Waxing has several benefits compared to other hair removal techniques. It is an effective method to remove large amount of unwanted hair at one go. Hair growth in waxed areas does not happen for 2–8 weeks. When hair is shaved or removed using a depilatory (shaving) cream, the hair is removed at the surface rather than the root, and within few days, the hair is visible on the surface. With these methods, hair tends to grow back in rough stubble form. Areas that are repeatedly waxed over long periods of time often exhibit re-growth that is softer.

Types of Hair Removal

--

2. Identify the different types of Hair removal methods (4)

/5

STRUCTURE OF THE HAIR

Hair Growth Cycle On an average, hair grows 1.25 cm per month.

It is estimated that we lose 80–100 hair per day on an average.

A single strand of hair does not grow continuously throughout life.

The stages of the life cycle of hair are as follows:

- Anagen
- Catagen
- Telogen
- Exogen

Fig. 4.1: Hair growth cycle

Activity

1. Draw and label the structure of the hair. (15)

Setting up for waxing

Working area preparation plays a vital role in any treatment. A Beauty Therapist is required to set the treatment area as per organisational standards. This will help in providing effective service.

These guidelines must be adhered to while preparing the working area.

- Cover the couch with a disposable sheet or paper to avoid spillage on the couch.

- To dispose of general and waxing waste, use two separate bins with inner lining
- Place the bins behind or under the couch.
- Select suitable heating unit as per the type of wax selected.
- Make sure that an antiseptic is available.
- Wear disposable gloves to prevent infections.
- Use only recommended applicator or disposable wooden spatula.
- Place cotton wool, tissues and jewellery bowl for the client. • Sterilise scissors, tweezers and other equipment that are to be used in the procedure.
- Ensure availability of aftercare leaflets that need to be given to the client.

Preparing the client Follow these procedures while preparing the client for waxing procedure.

- Provide a thorough consultation, explaining the procedure, aftercare precautions to be taken and the time required for the procedure.

- Ensure that the consultation and service are provided in a private room. • Make

the client feel comfortable.

- Encourage the client to ask questions without hesitation.
- Before starting the procedure, position the client comfortably, depending on the area to be waxed.

Take into account the person's mobility, comfort and privacy.

- Protect the client's clothes with towels and disposable sheet or clothing.
- Remove all jewellery from the area to be waxed. Contra-indications Before starting the treatment, we must make sure that the area where waxing has to be done is free from contra-indications.

Some of the contra-indications are:

- Recent scar tissue
- Hypersensitive skin
- Cuts or abrasions

- Bruise in or around the area to be waxed
- Allergy to any product a therapist may be using (like rosin found in sticking

plasters and wax

Types of waxing

There are two types of waxing — hot and cold.

Hot waxing This is the most common type of waxing offered by salons. It involves heating up of the wax and applying it on the body part where the unwanted hair is to be waxed. The wax sets on the skin. In this method, either a strip of paper or cloth is gently put over the wax and is pulled off in the direction opposite to the hair growth pattern, removing the hair. In other cases, a strip of paper or cloth is not put on the wax and it is pulled off from the skin after it cools off and solidifies.

Cold waxing

Cold waxing is like hot waxing, except that it comes in the form of readymade wax strips. Cold wax does not require heating. The strips are rubbed between the palms and the wax is warmed by the body temperature. The two strips are pulled apart and applied on to the skin. Then, the strip is pulled off, removing the hair. It is not as messy as hot wax.

Contraindications to waxing

Before starting the treatment, we must make sure that the area where waxing must be done is free from contra-indications.

Some of the contra-indications are:

- Recent scar tissue
- Hypersensitive skin
- Cuts or abrasions
- Bruise in or around the area to be waxed

- Allergy to any product a therapist may be using (like rosin found in sticking plasters and wax)

- Blood diseases (HIV, hepatitis)

- Use of skin-thinning drugs

- Diabetes

- Poor blood circulation

- Inflamed or aggravated skin

Activity

1. Identify two types of wax?

2. Where on the body is it recommend that we use hot wax? (2)

--

--

3. Where on the body is it recommended that we use cold wax? (5)

4. List 3 contraindications to waxing. (3)

/10

Precautions to be taken before waxing.

The Beauty Therapist must inform the client to take the following precautions

before waxing at least two days prior to the procedure.

- Do not apply body lotion, baby or body oil on the area where waxing is to be

done.

- Do not take bubble bath.

- Do not shave the hair of the area where waxing is to be done at least three days

before the procedure.

- When waxing eyebrows, apply eye pads to protect the eyes and petroleum jelly

to control the amount of hair being removed.

Tools, equipment and material are needed for waxing.

- Wax pot or wax cartilage
- Wax (hot or cold)
- Waxing strips
- Apron for the therapist
- Disposable gloves
- Plastic and paper sheet (to cover the couch and surrounding area)
- Disposable clothing or apron for the client
- Pre-wax lotion (to clean and remove oil from the client's skin)
- Purified, non-perfumed powder (to dry the skin and hair)
- Cotton wool (for applying products)
- Scissors (to cut long hair or strips)
- Tweezers (for removal of stray hair)

- Spatulas (to apply the wax)
- Tissues
- Post wax lotion
- Barrier cream (Vaseline)
- Orange stick
- Two bins with liners
- Pillow
- After wax oil
- Cleanser
- Towels
- Jewellery bowl

Client consultation

Client record card A Beauty Therapist is supposed to note down all details of the client as per the standard format in a client record card. Note down if the client has any contra-indication or is allergic to some product. Also, jot down the client's preference for products. The client's record card must contain complete information of the client.

Conducting skin sensitivity test

It is important to conduct a skin sensitivity test before proceeding with the waxing.

Ask the client for permission before starting the procedure.

Follow these guidelines while conducting the skin sensitivity test.

- Analyse the skin condition by performing a skin sensitivity or patch test. The test must be performed on the forearm as it, generally, does not have hair and is dry.
- Perform the test at least 24 hours before the actual procedure.
- Record the observations on a client record card.

- Check if the temperature of the wax first before applying it on to the client's forearm.
- Observe for reactions on the client's skin after the wax is removed.
- Ask the client to inform about redness, swelling or irritation for the next 24–48 hours.
- In case there is a reaction, suggest that this treatment is not suitable for the client.

Waxing procedure

Step 1: Make the client feel comfortable.

Step 2: Choose the most appropriate pre-wax application product.

Step 3: Identify the area to be waxed.

Step 4: Heat wax in a heating unit until it melts.

Step 5: Dust the area with powder before applying the wax. Baby powder or corn starch will absorb body oils and moisture, allowing the wax to stick to the hair (not the skin), making the procedure less painful.

Step 6: Test the temperature of the wax by applying it on your wrist.

Step 7: Apply the warm wax on the skin with a small wooden spatula. Check the length of the hair that has to be removed. The length of the hair must be 1/8 to 1/4 inch (3 to 6 mm). If the hair is too short, then the wax will not be able to pull out the hair from the root. If the hair is too long, significant discomfort might be experienced by the client.

Step 8: Take a strip of cloth, place it on to the wax and press it gently in the direction of hair growth. Step 9: Once the wax has cooled and slightly hardened, pull the wax strip in direction opposite to that of the hair growth. Hold or stretch the skin tightly while pulling the strip. Do this quickly. Do not pull it off at a 90° angle but at a shallower angle.

Step 10: Once the strip is removed, hand pressure can be applied to the area where waxing has been done to minimise discomfort.

Step 11: Remove stray hair with tweezers.

Step 12: Request the client to check the waxed area in a mirror.

Step 13: Apply after-wax lotion on the body part where waxing has been done.

Step 14: Brief aftercare advice to the client.

Aftercare Advice

Provide this advice to the client after the procedure.

- Wash the hands, and then, apply an antiseptic cream or lotion on the treated

skin for soothing it. Avoid touching the area with unclean hands.

- Avoid using deodorant, perfume or powder on the treated area.

- Avoid taking hot or bubble shower for at least 48 hours as it can cause irritation.

- Avoid going to the gym or doing any kind of workout or play an outdoor game for

48 hours as it can increase perspiration in the waxed area.

- Also, avoid exfoliating the area, swimming, or sunbathing for at least 48 hours

post-wax.

- Wear clean cotton clothes to avoid irritation.

- Avoid wearing tight fitting clothes as they can trap bacteria close to the skin and

cause infections.

TINTING

Eyebrow tinting is a quick treatment with amazing results, with the ability to make eyebrows appear fuller and darker in the blink of an eye. When combined with an eyebrow shape be it threading or waxing a defined beautiful pair of brows can be achieved in minutes.

The lashes appear clearly longer and more voluminous, as the tinting accentuates the full length of the lashes faded by sun and water. With tinted eyelashes the eyes

look more vivid, even in the morning when waking up they already look expressive and attractive for weeks – even without mascara.

How does it work?

The process involves a quick and non-surgical procedure using vegetable dye as tint. Compared to putting on mascara or colouring in your eyebrows, the effects of eyelash and eyebrow tinting are very natural.

Brows & Lashes are dyed to match hair colour or to accentuate facial features. desire.

Choose between

- black
- blue-black
- natural brown,
- light brown

The best result is achieved when applying the tint regularly because with each tinting the colour will penetrate deeply into the eyelashes leaving them more intensely and durably coloured.

TINTING BENEFITS

Eyelash tinting will benefit people that are sensitive to make-up, people who are active in sports (especially swimming) and people who have no time to apply make-up daily. This process is also ideal for people who wear contact lenses because they don't have to suffer putting on mascara any longer.

What Happens During the Treatment?

A typical eyelash tinting takes around fifteen minutes. Because of this, tinting your eyelash can fit into the busiest of schedules. Once you arrive at the salon, the therapist will place cotton under your closed eyes and then apply a small amount of vegetable dye onto your eyelashes. After ten minutes, the dye is removed with water. The results could last around four to six weeks.

What you need for tinting

Tint Brush

Tint Protection Pads (2)

Intensive Soothing Under Eye Gel Pads

Headbands

Glass bowl

Birchwood Stick

Mascara Brushes

Small bowl of water

Cotton Swabs

Cotton Balls or Rounds

Peroxide

Dropper

Preparation of the Tint

1. Mix $\frac{3}{4}$ inch of tint colour cream with 2-4 drops of peroxide solution until the consistency is a creamy paste. (Make sure consistency is not runny or drippy.)

Note: Temperature fluctuation can cause settlement of developer solution, but this has no negative effect on the quality of the product. Shake well.

Store in a cool place.

Note: The colour of the mixture is not the colour that the hair will be once it is tinted. To get an idea of the final colour, leave a wooden applicator in the mixture for the desired time.

2. Let set for at least 3 minutes while you prepare your client.

Tinting Procedure

1. Client should be sitting on a facial bed with head slightly tilted back.
2. Cleanse eyelashes and eyebrows thoroughly with Eye Makeup Remover Foam.

Lashes and brows should be free of oil and makeup.

3. Instruct the client to look up. Remove the protective backing from the Eye Pad (pictured) and place the pad under the lower lid, as close as possible to the lower lash line, without covering lashes. Alternately, you may use a Paper Eye Protection Pad. To do so, first apply a thick layer of barrier cream (Vaseline) under the lower eyelid. Then place a Wet Paper Eye Protection Pad under the lower lid, which will prevent the tint from staining the skin. The barrier cream (Vaseline) will prevent the pad from moving.

4. Using a tint brush, apply cream tint to lower lashes first on both eyes. Make sure the tint covers lashes, including those at the corners of the eyes, from base to tip.

When lower lashes are completed, instruct the client to close his/her eyes until the application and removal process is completed.

5. Apply mixed tint to upper lashes from base to tip. Again, make sure the corner lashes are covered. If tint accidentally gets in the eyes, take your client to an eyewash station and flush the eyes with plain water immediately! If you do not have an eyewash station, flush the eye with saline solution or warm water and pat dry. If no irritation occurs, you may reapply the tint immediately.

6. When applying to eyebrows, make sure eyebrow hair is completely covered, but do not press the dye into the skin.

7. If any tint gets on the face, remove it as soon as possible with warm soap and water.

8. Developing time will differ depending on temperature fluctuation, the texture and coarseness of the client's hair, and the hair's original colour. Although the normal time for developing is 10 minutes for lashes and 3 minutes for brows, these times may produce results darker than expected. If you are working with Middle Brown, Brown, we recommend that you allow eyelashes to develop for 3 minutes and the eyebrows to develop for one and one-half minutes. Then cleanse them and check the colour. If the eyelashes and/or eyebrows are not dark enough, re-apply and allow to them to process again until the desired colour is achieved.

Check the colour frequently. You can always reapply to go darker. However, if they become too dark, you will be unable to lighten them. The colour will have to wear off over time.

9. Remove protection pads from under eye area.

10. While your client's eyes are closed, use a dampened cotton round with warm water to remove product until no residue is visible. Hold tissue near eye area to capture any excess water.

11. Provide a hydrating and soothing finishing touch around the eyes.

12. Calm and tame eyebrows by brushing with the mascara brush.

13. Hand your client a mirror so he/she can see his/her fabulous new look!

Note: The client can wash their face, apply makeup, and resume all activities immediately.

Note: If you get tint on your hands while mixing, use a cotton ball dampened with Tint Spot Cleanser to remove the tint. Wash your hands with soap and water immediately. Do not use the Tint Spot Cleanser on the face. Use soap and warm water to remove any tint on the face.
