

Measure and Cut Tiles

- The second way of measuring how much tile you need to cut away is by using a tape measure. Place it up against the wall and take note of where the tiles you already laid. Using this measurement, make a mark either end of the tile you'd like to cut.

Using a number of tiles using spacers

- Place spacers at each corner of your tile as you're laying it. Push the tiles together until the spacer has contact with each other. You can remove spacers shortly after you finish the tile installation and you can re-use them in a future project.
